Goldman Sachs Australia Pty Ltd

Introducing our ANZ Data Centre Supply-Demand model: We project ANZ demand to scale from 1.6GW today to 5.2GW by 2030E (26% CAGR) in our base case, and up to 7.0GW in our bull case (34% CAGR). Demand is constructed in two layers: Layer 1 captures everything running on general-purpose racks; layer two is accelerator load – ANZ's share of global token usage, adjusted for an efficiency curve as well as training. This materially outpaces supply, which we project grows from 1.6GW to 4.5GW by 2030E, creating a 0.7GW shortfall. Australia is a mature, tier-one DC market: low geopolitical risk combined with subsea connectivity into Asia underwrites an attractive hyperscaler investment case. Vacancy rates remain low, positioning Australia at the upper end of global pricing – below Singapore and Tokyo, but broadly level with top-tier North American and European hubs.

Funding strategies will be a key differentiator: We project A$50/65bn of supply/demand DC investment over the next 5 years, excluding IT hardware, and A$130-150bn including IT. Our coverage is currently fully funded for its WIP; land banks are not and require solutions given speed to market advantages. We assess the business case for capital recycling that provides incremental funding at an opportunity cost of ~4.9% pre-tax vs 5.5% for institutional debt – a ~60bp saving, and +200bps savings against unrated and hybrid debt.

We compare Traditional DCs vs AI factories/neoclouds: AI factories deliver higher velocity returns; however, the risk profile is wider and dependent on re-contracting before chip obsolescence, whereas traditional DCs secure long-term cash flows. AI factories earn yield on cost of 30%+ and 20-35%+ IRRs compared to Traditional DCs YoC of 10-15% and IRRs of 11-20%. That premium is funded with 2-4x the capex per MW (A$35-70mn vs A$15-20mn) but generates 8-10x more net revenue of A$29-36mn vs A$2.9-4.5mn. GPU depreciation caps EBIT margins at 30-35% vs 50-55%, and contracts run 4-6yrs vs 10-20yrs.

We initiate on 5 digital infra names. **GMG.AX - Buy** (TP A$32.0, +22% upside, 21x FY27 EV/EBITDA) on a strategic land bank and secured power capacity accelerating its DC pivot. **MP1.AX - Buy** (TP A$25.9, +31% upside, 18x) on a high-operating-leverage model built for AI workloads. **NXT.AX - Neutral** (TP A$11.0, +6%, 22x FY29e discounted): the best operational assets, but the largest funding gap. **DGT.AX - Neutral** (TP A$2.6, +8% upside, 15x FY29e discounted) on SYD1 ramp. **MAQ.AX - Neutral** (TP A$58.0, +14% upside, 14x blended).

Goldman Sachs does and seeks to do business with companies covered in its research reports. As a result, investors should be aware that the firm may have a conflict of interest that could affect the objectivity of this report. Investors should consider this report as only a single factor in making their investment decision. For Reg AC certification and other important disclosures, see the Disclosure Appendix, or go to www.gs.com/research/hedge.html. Analysts employed by non-US affiliates are not registered/qualified as research analysts with FINRA in the U.S.

PM Summary

1. GS ANZ Data Centre Supply-Demand Model

We introduce our proprietary ANZ Data Centre Supply-Demand Model: a bottom-up framework that forecasts demand against the oncoming supply pipeline to test the business case for new build and the returns it can support.

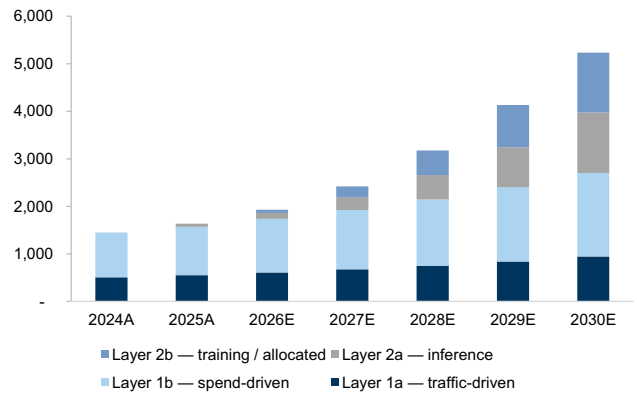

We project ANZ IT load demand to scale from 1.6GW today to 5.2GW by 2030E (26% CAGR) in our base case, and up to 7.0 GW in our bull case (34% CAGR). This significantly outpaces supply, which we project will grow from 1.6GW to 4.5GW by 2030E, creating a shortfall of 0.7GW.

Demand is constructed in two layers. Layer one covers everything running on general-purpose racks. Layer two is accelerator load, ANZ's share of global token usage (adjusted for an efficiency curve) as well as training. Everyday computing tasks (Layer 1) are growing at a modest, steady pace of 13% annually. The real acceleration comes from AI as we forecast token usage to grow IT load from ~66MW today to ~1.3GW by 2030E. Training will add another ~1.3GW MW of demand.

Supply is the bottleneck that we expect will support pricing and secure early commitments: Funding constraints, regulatory changes and local community pressure are restricting supply. We forecast a supply shortfall of ~0.7GW or 15% of addressable demand by 2030 that should translate into higher rental prices and tenants booking space far in advance. Some nuance exists as hyperscaler facilities are signing terms on lower rates, but compensating this with lengthier lease terms.

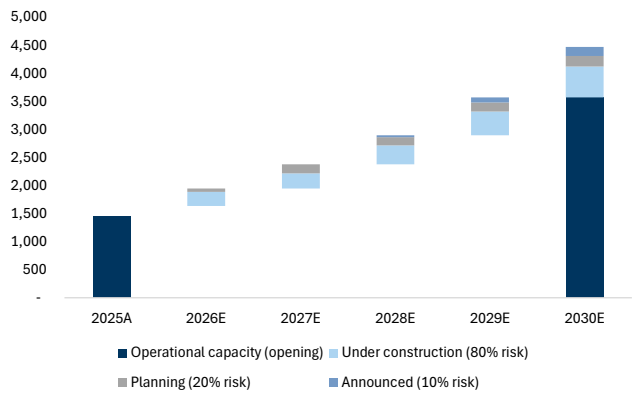

We expect ~A$50-65bn of capex is required to fund supply/demand at A$18mn/MW - excluding IT equipment. Factoring in servers, chips, and high-density hardware, all-in capex scales to A$130–150bn depending on specifications. Industry feedback confirms US hyperscalers are investing in Australia for its regulatory stability, low sovereign risk, and critical subsea links to Asia. As a Five Eyes partner, Australia stands as a primary beneficiary of the severe grid and power bottlenecks.

Exhibit 1: We expect Layer 1b - spend-driven - to be the largest demand component

2. Key Single Stock Views

Initiate on Goodman Group (GMG.AX) with a Buy rating and A$32 TP (+22% upside). Our positive view is underpinned by: (1) a strategic land bank in high barrier-to-entry urban locations, run by proven, well-aligned management; (2) tight vacancies, positive reversion and a constrained pipeline driving steady core income growth; and (3) data centre development as the accelerator, backed by a secured global power bank. We derive our 12m TP of A$32 for GMG using 21x FY27 EV/EBITDA. We estimate GMG's share of DC powerbank to be worth A$28bn vs. A$11bn implied by its share price.

Initiate on Megaport (MP1.AX) with a Buy rating and A$25.9 TP (+31% upside). Our positive view is underpinned by: (1) a global network footprint and entrenched carrier-neutral ecosystem; (2) a high-margin subscription base that self-funds growth on a largely fixed cost base; and (3) a full-stack AI offering as the accelerant, bundling network, compute and storage to win training and inference workloads. We derive our 12m TP of A$25.9 for MP1 using 18x FY27 EV/EBITDA.

Initiate on NEXTDC (NXT.AX) with a Neutral rating and A$11 TP (+6% upside). Our balanced view is underpinned by: (1) structural demand intact on cloud migration and AI density, but largely priced in; (2) funding the key constraint, with rising financing costs leaving a c.A$1bn shortfall against WIP; and (3) contract timing and customer concentration tempering earnings visibility. We derive our 12m TP of A$11 for NXT using 22x FY29 EV/EBITDA discounted by 9.0%.

Initiate on DigiCo REIT (DGT.AX) with a Neutral rating and A$2.6 TP (+8% upside). Our balanced view is underpinned by: (1) SYD1 as the low-latency, high-yielding anchor asset, though growth hinges on the FY27-28E ramp; (2) capital re-weighted out of the US to fund the higher-returning SYD1 and ADL1 pipeline; and (3) a robust balance sheet, though distributions are not fully FFO-funded. We derive our 12m TP of A$2.6 for DGT using 15x FY29 EV/EBITDA discounted by 9.9%.

Initiate on Macquarie Technology (MAQ.AX) with a Neutral rating and A$58 TP (+14% upside). Our balanced view is underpinned by: (1) DC the core value driver, converting the 47MW IC3SW site into billing capacity, with growth beyond 19MW customer-led; (2) a data sovereignty moat in Cloud and Government, though adoption is slow; and (3) Telecom structurally challenged but provides funding optionality. We derive our 12m TP of A$58 for MAQ using 7x FY27 EV/EBITDA for telecom, 14x FY27 EV/EBITDA for CS&G, and 15x FY29 EV/EBITDA for DCs discounted by 8.9%.

Transfer coverage of Infratil (IFT.NZ) from Niraj Shah to Chris Boulus. No change to earnings, recommendation (Buy rated) or TP (NZ$17.6, +31% upside).

Exhibit 3: GS ANZ DC coverage list - Close prices as of 8 October 2026

Company	Lead Analyst	GS Rating	Price	TP	Upside / Downside	GSe vs VAe Revenue		GSe vs VAe EBITDA		12mf cons. EV/EBITDA		
						FY27E	FY28E	FY27E	FY28E	Current	3Y avg.	vs. avg

3. The role of Funding in ANZ Digital Infrastructure

Access to capital translates directly into speed to market: funded developers bypass the power bottleneck by self-funding infrastructure or locking in long-term utility commitments ahead of competitors. We assess our coverage against four criteria:

Exhibit 4: Funding scorecard

Ranking	Company	Capital recycling	Third-party capital	Self-funding ratio	Dilution risk	Cost of Debt	Gearing	Liquidity (A$bn)
1	**Goodman (GMG)**	Strong	Strong A$75bn platform	Strong	Low	4.6%	19.5%	18.8*
2	**DigiCo (DGT)**	Moderate	Moderate, sponsor level	Moderate	Moderate	6.0%	18.0%	1.2
3	**NEXTDC (NXT)**	Limited	Evaluating JVs	Weak	High	6-8%	29.0%	9.8
4	**Macquarie Tech (MAQ)**	Moderate	Moderate	Moderate	Moderate	5.5-7%	15.0%	0.6
5	**Megaport (MP1)**	Limited	Limited	Moderate	Moderate	5-6%	10.0%	0.36

**GMG last reported, whereas other companies disclosed pro-forma liquidity post transactions/contracts*

Source: Data compiled by Goldman Sachs Global Investment Research

WIP is manageable. Assuming capex of A$18mn/MW, active WIP pipelines carry only minor near-term funding gaps for GMG (500MW), NXT (537MW), DGT (70MW) and MAQ (40MW). The real capital hurdle is the long-term landbank. GMG is uniquely insulated with A$10bn of excess liquidity, and its capital-light, third-party partnership model materially mitigates balance sheet strain; however, all players will require large amounts of capital to fully fund their landbank.

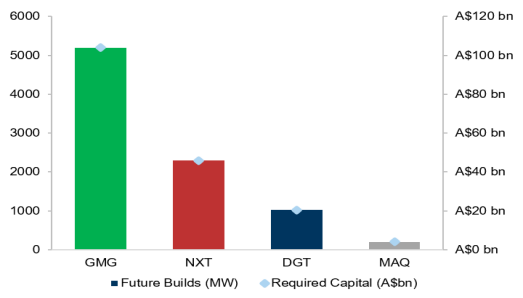

The business case for capital recycling: On our illustrative build, recycling through a fee platform prices new funding at the opportunity cost of ~4.9% pre-tax vs 5.5% for institutional debt – a ~60bp saving, and +200bps savings against unrated and hybrid debt a pure-play developer would otherwise draw on. The conclusion: a developer with a managed funds platform funds its program at a materially lower blended cost, and can keep funding after a balance sheet lender would have stopped. This could prove as an effective source of funding because GMG will require A$104bn, NXT A$46bn, DGT A$20bn and MAQ A$4bn to fully fund their landbanks.

GMG (Buy) – best placed on funding. Goodman originates, develops and places assets into managed partnerships funded by third-party institutional capital, retaining a co-investment stake and an annuity management fee. Development capacity is a function of investor appetite for stabilised digital infrastructure – currently deep – not of Goodman's own gearing.

NEXTDC (Neutral) – strongest case for recycling, given the widest gap in our coverage between opportunity and funding capacity.

Exhibit 5: Illustrative capital recycling costs and future builds vs. capex

Step	Illustrative	Notes
Stabilised asset value	A$1,000m	Post lease-up, contracted
Exit cap rate	5.50%	Implies A$55m stabilised NOI
Interest syndicated to third parties	75%	A$750m gross proceeds
Co-investment retained	25%	Income share not surrendered
Transaction costs at 1.25%	(A$9.4m)	Stamp duty, advisory, legal
Net capital released	**A$740.6m**	
Income surrendered (75% × A$55m)	A$41.3m	The true economic cost
Less base mgnt fee, 50bp A$750m	(A$3.8m)	Annuity on third party AUM
Less development and leasing fees	(A$1.5m)	Illustrative
Net annual cost	**A$36.0m**	
Cost of recycled capital	**4.86%**	A$36.0m ÷ A$740.6m
Transaction without a fee platform	*5.57%*	A$41.3m ÷ A$740.6m

4. Comparing traditional DC vs AI factory metrics in detail

- **AI factories out-earn traditional DCs, but on materially shorter duration.** Capex of A$35-70mn/MW versus A$15-20mn funds net revenue of A$29-36mn versus A$2.8-4.5mn and EBITDA of A$22-27mn versus A$2.1-3.3mn, driving 30%+ YOC and 25-35%+ IRRs against 10-15% and 11-20%. GPU depreciation caps EBIT margins at 30-35% versus 50-55%, and contract tenure is 4-6yrs versus 10-20yrs. The trade is higher returns by contract renewal risk for AI factories vs stable returns and lower counterparty risk for DCs.
- **Neocloud leasing is accretive, and does not require significant capital outlay.** On a 100MW lease at cA$18mn capex/MW, selling to a neocloud returns 22% versus 16% for a hyperscaler, with Yr1 YOC re-rating from 15% to 21% on a c35% leasing premium (A$3.6mn EBITDA vs A$2.7mn/MW). The IRR spread over each project's own cost of capital is 1,017bps versus 773bps. Allocating c10-20% of portfolio capacity lifts blended IRR to 16-17% from 15.7% with no material change in capital intensity and limited counterparty risk.
- **MP1 generates 8x equity value per dollar deployed vs NXT.** Normalised to cA$260mn Yr1 EBITDA, MP1's 31% project IRR exceeds its 8.5% cost of equity by >22pts against NXT at 11%. On 100% equity funding MP1 creates cA$0.7 of equity value per A$1 of capex versus A$0.1 for NXT, with c3x less capex intensity (MP1 A$525mn, NXT cA$1.8bn), and payback 2yrs versus 7yrs. Critically, NXT's case rests entirely on indexation - the 2.5% escalator lifts Yr15 EBITDA to cA$370mn and a 21% exit YOC, but ex-escalators equity value is negative. We think investors will be more focused on funding source for NXT, compared to contract renewal for MP1.
- **Pricing has inflected, supporting both revenue and the renewal case.** H100 1yr contracts are +c60% YTD, Nebius raised list prices 20% from 1 October with payback compressing to 22 months, and IREN is pricing 1yr deals at US$40mn+/MW which represents c2x premium vs 3yr deals. Also, CoreWeave's A100 renewal implies c9yrs of useful life against a 4-6yr industry assumption – supportive of MP1's ability to sweat its fleet beyond the initial contract term.

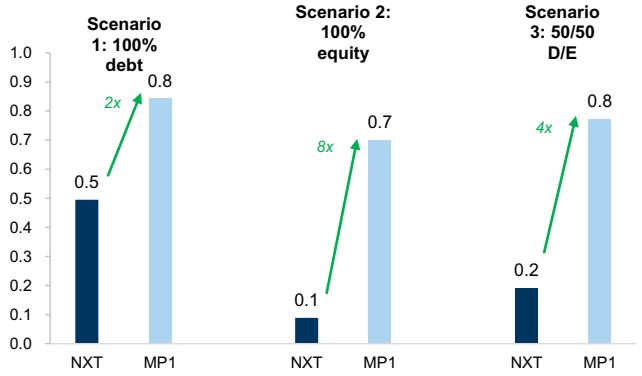

Exhibit 6: Leasing excess capacity to a neocloud delivers 600bps of IRR uplift vs a hyperscaler

Metric	ANZ data centre	US AI factory
Net revenue (A$mn/MW)	2.8-4.5	29-36
Capex (A$mn/MW)	15-20	35-70
Facility EBITDA margin (%)	67-80%	70-80%
EBITDA/MW (A$mn/MW)	2.1-3.3	22-27
EBIT margin (%)	50-55%	30-35%
EBIT/MW (A$mn/MW)	2.0	11.4
Yield on cost (%)	10-15%	30%+
Levered IRR (%)	11-20%	25-35%+
Contract Tenor (yrs)	10-20yrs	4-6yrs

1. GS ANZ Data Centre Model

1. ANZ Data Centre Industry Model

We introduce our proprietary ANZ Data Centre Supply-Demand Model: a bottom-up framework that forecasts demand against the oncoming supply pipeline to test the business case for new build and the returns it can support. We forecast Data Centre IT load demand to grow from 1.6GW today to 5.2GW by 2030E (26% CAGR) in our base case, 7.0GW in our bull case (34% CAGR) and 3.2GW in our bear case (14% CAGR). This compares to current supply of 1.6GW growing to 4.5GW by 2030e, creating a shortfall of 0.7GW. Our model indicates structurally tight data center supply-demand dynamics, driven by the ongoing compression of vacancy rates highlighted in recent CBRE data. We think this supply deficit will support pricing power for operators over the medium term. Key risks include: escalating power and water constraints, rising utility tariffs, and localised community or regulatory pushback as key structural risks to future capacity expansion.

The model differs from the market in three respects. First, we split standard computing from AI workloads, tracking general-purpose servers separately from high-density AI hardware. Second, we reconstruct consumer demand from the bottom up using granular, local ACMA traffic data rather than generic national averages. Finally, we anchor local AI demand to Goldman Sachs' global token forecasts and apportion Australia's share based on actual data center capacity rather than population.

Three key conclusions for investors

1. **ANZ DC Demand compounds at 26% to 5.2GW by 2030E and 48% of it is token-elastic**. Everyday computing tasks (Layer 1) are growing at a modest, steady pace of 13% annually. The real acceleration comes from AI as we forecast token usage to grow IT load from ~66MW today to ~1.3GW by 2030. Training will add another ~1.1GW MW of demand, on our estimates.
2. **Supply is the bottleneck, which should push up prices and secure early commitments:** Funding constraints, regulatory changes and local community pressure are restricting supply. We forecast a supply shortfall of ~0.7GW or 15% of addressable demand by 2030 that should translate into higher rental prices and tenants booking space far in advance. Some nuance exists as hyperscaler facilities are signing terms on lower rates, but compensating this with lengthier lease terms.
3. **We expect ~A$52-65bn of capex is required to fund supply/demand at A$18/mn MW - excluding IT equipment.** Factoring in servers, chips, and high-density hardware, all-in capex scales to A$130–150bn depending on specifications. Industry feedback suggests US hyperscalers are investing in Australia for its regulatory stability, low sovereign risk, and critical subsea links to Asia. As a Five Eyes partner, we believe Australia stands as a primary beneficiary of the severe grid and power bottlenecks currently stalling US data center expansion.

Exhibit 9: We introduce our ANZ DC Demand Model

ANZ DC Demand Model	2024A	2025A	2026E	2027E	2028E	2029E	2030E

2. Demand Assumptions

Demand is constructed in two layers. Layer one covers everything running on general-purpose racks. Layer two is accelerator load, sized global token consumption, ANZ's share of that pool, and an energy-per-token efficiency curve as well as training.

Exhibit 10: Below, we outline the layers of our demand side model
Model architecture

Layer	Hardware	Driver	Unit	Nature
1a Traffic-driven	General-purpose racks	ACMA channel traffic	EB/yr	Demand-led
1b Spend-driven	General-purpose racks	AU IT and cloud spend	A$bn	Demand-led
2a Inference	Accelerator racks	Global tokens × AU share × efficiency	T tokens/day	Demand-led
2b Training / allocated	Accelerator racks	Named campuses × phased energisation	MW per campus	Supply-led

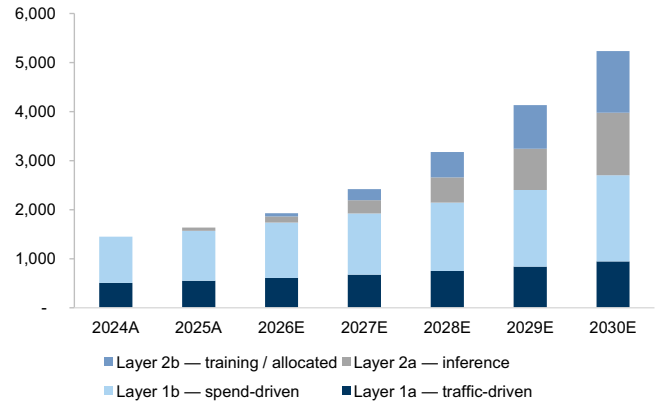

Source: Goldman Sachs Global Investment Research

Exhibit 11: We forecast for 5.2GW of ANZ demand in 2030, consisting of 2.7GW in Layer 1 and 2.5GW in Layer 2
ANZ demand build by layer, base case, MW-IT

ANZ Demand MW-IT	2024A	2025A	2026E	2027E	2028E	2029E	2030E	CAGR
Layer 1a — traffic-driven	508	550	607	674	751	841	945

Exhibit 12: We expect Layer 1b - spend-driven - to be the largest demand component
ANZ demand build by layer, MW-IT

Source: ACMA, ABS, Goldman Sachs Global Investment Research

2 (i) Demand Layer 1 (Traffic and spend)

Demand Layer 1 captures load running on general purpose infrastructure. The traffic-driven sub-layer forecasted has been built from Australia Communications and Media Authority (ACMA) channel-level data. At June 2025, 99% of adults had home internet access, 99.7% used a device to go online, 93% had a fixed or wireless connection, and 80% were on the NBN (National Broadband Network). All base growth must therefore come from population and intensity per user. ACMA reports 4.1 devices connected to the internet (per user), up from 3.7 in 2024. The more durable signal is the distribution: 40% of adults now use five or more devices, up from 30% in 2024, concentrated in the under-55 cohorts (35–44s at 48% from 34%; 25–34s at 43% from 25%). On traffic, we model ACMA's three channels separately as total EB/yr downloaded data grows from ~58 exabytes/yr to ~105 by 2030 (12% CAGR). Layer 1 is converted to megawatts through a watt-intensity coefficient calibrated so that base plus AI reproduces the observed ~1,637MW in 2025.

Exhibit 13: We expect AU traffic to reach 104.5EB in 2030E
Traffic build, Australia, m EB/yr

Traffic build - Australia (EB/yr)	2024A	2025E	2026E	2027E	2028E	2029E	2030E	*CAGR*
NBN (80% of volume)	46.1	47.4	52.7	58.7	65.8	74.0	83.6	
Mobile (16%)	9.2	9.5	10.5	11.7	13.2	14.8	16.7	
Non-NBN (4%)	2.3	2.4	2.6	2.9	3.3	3.7	4.2	
Total	**57.6**	**59.3**	**65.8**	**73.4**	**82.2**	**92.5**	**104.5**	***12%***

Source: ACMA, Company data, Goldman Sachs Global Investment Research

2 (ii) Demand Layer 2 - AI Overlay, token usage and training

Layer 2a (inference) is token-elastic. We anchor global token volume on GIR estimates of 170 trillion tokens per day today, rising toward 4 quadrillion per day by 2030, consistent with GIR's forecast that agentic AI drives a 24x increase in token consumption by 2030 (55x enterprise agents, 12x consumer agents). The ANZ share is anchored on ANZ % share of global Data centre capacity which approximates to 1-2% over the next 5 years.

The conversion runs in four steps: global tokens × ANZ share gives tokens per day;

multiplied by joules per token and divided by 86,400 seconds gives average power; divided by a 0.55 load factor and a 0.65 accelerator share of rack IT power grosses average draw up to installed capacity. That produces a constant of ~32.4 MW-IT per trillion tokens served per day in 2025, decayed thereafter by the efficiency curve.

Our assumptions:

55% Load Factor: When you ask an AI model a question, you expect an immediate response. If an operator only built enough server capacity for average traffic, the system would stall or crash during peak afternoon hours. To guarantee low response times, companies must install roughly twice as much compute hardware as they need on average, leaving the cluster running at roughly 50% to 60% average utilisation over 24 hours.

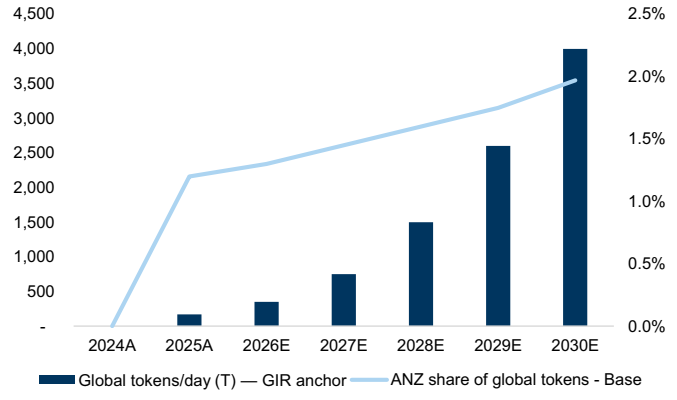

65% Accelerator Rack Share: Reasonable. A 65% accelerator rack share is reasonable because across standard AI compute designs, GPUs or specialized ASICs account for roughly 60% to 70% of total IT power draw, with the remainder consumed by host CPUs, high-speed memory, InfiniBand/Ethernet switches, and chassis power distribution.

Exhibit 14: Demand layer 2

Layer 2a	2025A	2026E	2027E	2028E	2029E	2030E

Source: Goldman Sachs Global Investment Research

Exhibit 15: We forecast for ANZ share of global tokens to approach 2% in 2030E
Global tokens/day vs. ANZ share of global tokens

Source: Goldman Sachs Global Investment Research

Layer 2b (training / allocated) is supply-led and deliberately not token-elastic. A hyperscaler siting a frontier training campus in Australia is making a capital-allocation decision driven by power availability, land, geopolitical stability and grid timing - not responding to Australian token consumption.

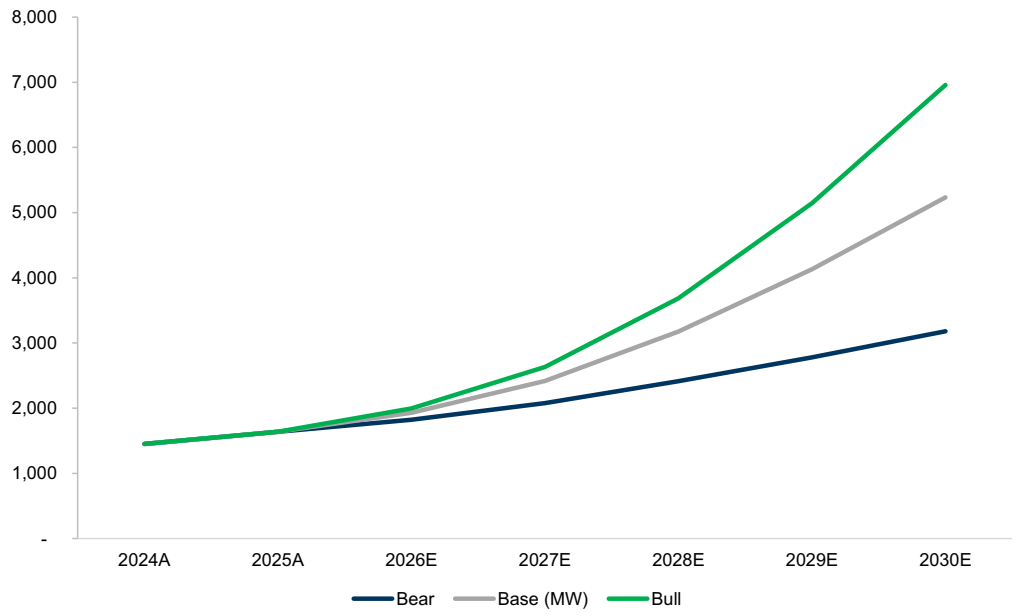

In aggregate ANZ DC Demand compounds at 26% to 5.2GW by 2030E and 48% of it is token-elastic. Everyday computing tasks (Layer 1) are growing at a modest, steady pace of 13% annually. The real acceleration comes from AI as we forecast token usage to grow IT load from ~66MW today to ~1.3GW by 2030. We estimate training will add another ~1.3GW MW of demand.

Exhibit 16: ANZ DC Demand

Exhibit 17: ANZ Data Centre Demand (MW) – scenario analysis

Source: Goldman Sachs Global Investment Research

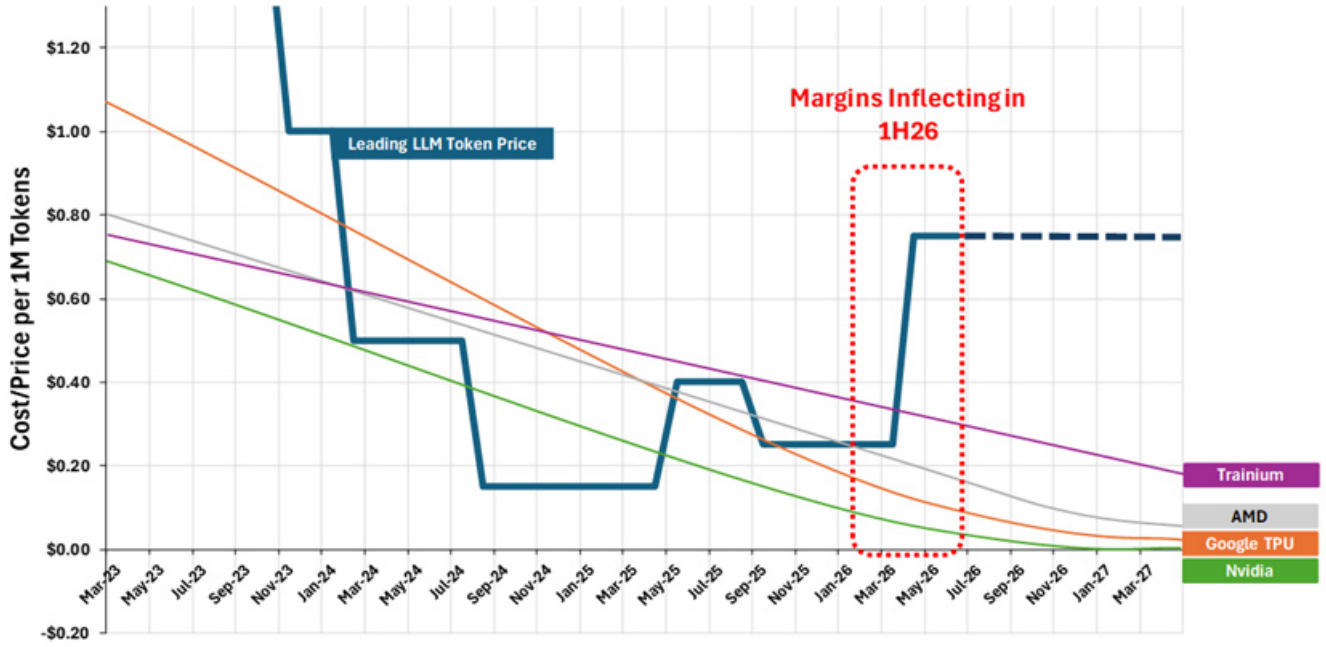

Token efficiency will drive a range of outcomes: We assume Energy per token improves materially through better silicon, model distillation, quantisation and serving optimisation. We assume 2.0x cumulative improvement by 2030 in our base case and deliberately run efficiency inverse to adoption. In a high-adoption world, gains are competed away by longer reasoning chains, larger retrieved context and multimodal output rather than banked as lower power draw.

Exhibit 18:
Australian token share and efficiency assumptions

ANZ Token share	2024A	2025A	2026E	2027E	2028E	2029E	2030E	*CAGR*

Source: Goldman Sachs Global Investment Research

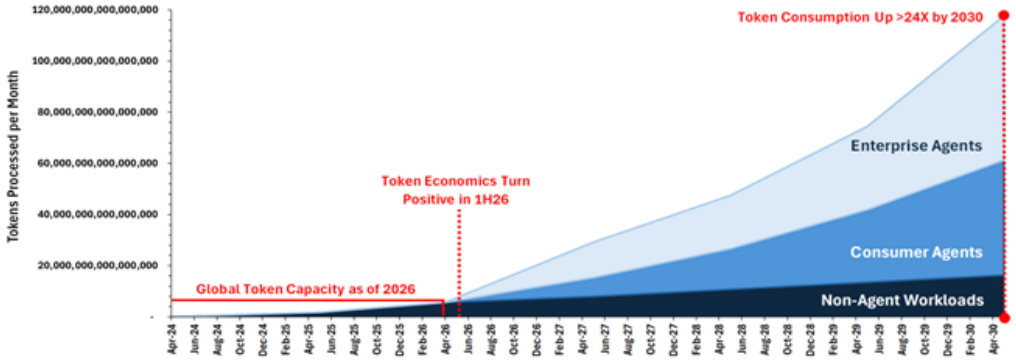

Exhibit 19: Token economics are beginning to inflect, as compute cost declines continue and token prices stabilise

Source: Goldman Sachs Global Investment Research

Our global team estimates consumer AI agents can lift global token consumption 12X by 2030E. Consumer AI queries are already a large and growing market, but the mix is shifting quickly as AI overviews and LLM agentic queries take share from traditional search. At ~23bn AI queries per day by 2030E, up from ~5 billion in 2025, we estimate up to 30% will be directed to agents across search, shopping, travel, email, and other personal productivity functions. This would add 60 quadrillion tokens per month by 2030, or 12X current global token consumption as of 2026.

Exhibit 20: By 2030, we estimate consumer and enterprise agents could push token consumption 24X above today's estimated global capacity.

Source: Goldman Sachs Global Investment Research

3. Supply Assumptions

Supply is built independently of demand. We start from 1.6GW of operational capacity today (per 451 Research) and then probability weight project-level data compiled from company disclosures, regulatory approvals and media reports. We estimate ANZ supply will grow from 1.6GW today to 4.5GW by 2030 (21% CAGR) with the majority of capacity coming from Sydney and Melbourne. The key bottlenecks to delivering supply are: Funding (explored in section 2), Grid connection availability and regulation/local community pressures. AEMO estimates data centres accounted for around 3% of total grid-supplied electricity consumption from the NEM (National Energy Market) in FY2026, projected to rise to 8% by FY2030 and 13% by FY2036. Industry sources say connection queues in Western Sydney, Inner Melbourne and South East Queensland run 3-5 years, and transformer lead times of 2-4 years have the ability to cap the 2027-30 ramp.

Exhibit 21:
Deliverable supply build, MW-IT

ANZ Supply (MW)	2024A	2025A	2026E	2027E	2028E	2029E	2030E
Operational capacity (opening)	1,351	1,452	1,637	1,947	2,377	2,896	3,570
Under construction (80% risk)			250	270	340	424	550
Planning (20% risk)			60	160	146	160	190
Announced (10% risk)			0	0	33	90	159
Deliverable Supply (closing)	**1,452**	**1,637**	**1,947**	**2,377**	**2,896**	**3,570**	**4,469**

Source: 451 Research, Company disclosures, Regulatory approvals, Media reports, Company data, Goldman Sachs Global Investment Research

Our proprietary supply pipeline is compiled from public operator announcements, investor materials, and key industry databases, including Data Centre Dynamics (DCD) and S&P Global's 451 Research. To capture the delivery timeline we segment the tracked pipeline into three phases: Under Construction (12 to 30-month lead time), Planning (24 to 48-month lead time), and Announced (48+ month lead time). Based on the attributes of each project, we score them using a weighted scorecard incorporating project status, distance from the CBD, funding status and power availability, to arrive at our view on the likelihood of delivery by 2030. **From the 7.5 GW of gross project capacity currently in our tracker, our supply model integrates ~2.8 GW as active, deliverable capacity by 2030.**

Exhibit 22: ANZ pipeline – all operators projects, Australia and New Zealand

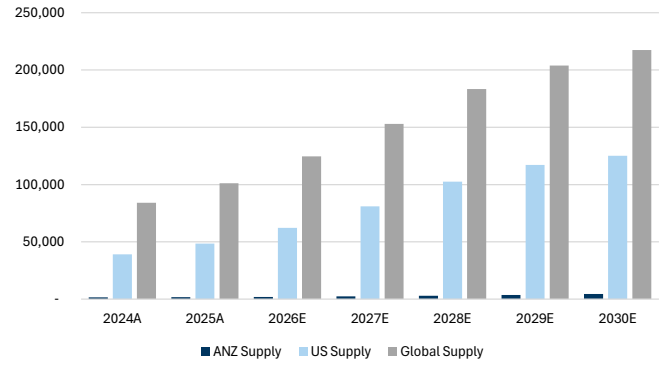

Exhibit 23: We forecast a step change in ANZ operating capacity driven by under construction and planned capacity
ANZ operating capacity waterfall chart (MW)

Source: Company data, Goldman Sachs Global Investment Research, Data Centre Dynamics

Our supply model has the ANZ data center market set to rise from 1.5% of global capacity today to 2% by 2030 while maintaining a steady 3.0% to 3.6% ratio against the US. Regionally, we project New Zealand will add ~50 MW of risked capacity, but Sydney and Melbourne remain the core engines-accounting for ~75% of the risked pipeline and are driving the longest connection queues at AEMO. Support has been backed by US hyperscalers who see low sovereign risk, clear regulations, and vital subsea routes to Asia in Australia. However, going forward we believe bringing new supply online is becoming increasingly difficult due to intensifying political pressure and community opposition. We note that GMG cancelled its $1.2bn Lane Cove facility in September 2026 following reports of local opposition.

Exhibit 24: ANZ is 3% of US Capacity and 2% of Global Capacity over the next 5 years

Source: 451 Research, Goldman Sachs Global Investment Research

4. Supply Shortfall

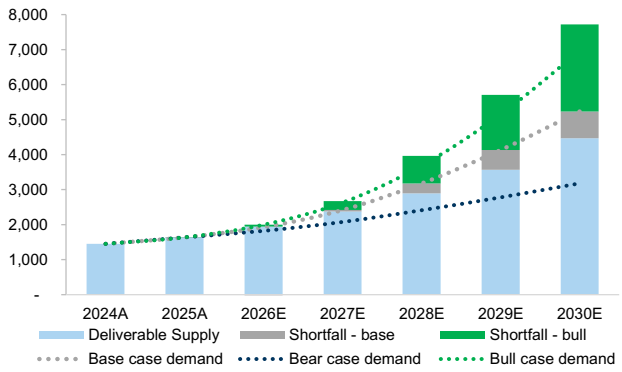

Our central conclusion is that the ANZ data center market will be undersupplied by 0.7GW by 2030. Demand will expand from 1.6 GW of IT load today to 5.2 GW by 2030 in our base case. Set against a projected deliverable supply of just 4.5 GW, the market faces a 0.7 GW deficit – equivalent to approximately 15% of total demand. This supply-demand gap widens to ~2.5 GW (a 35% shortfall) under our bull-case scenario, compared to a 1.3 GW oversupply in our bear case. In our view, these structurally tight dynamics will continue to incentivise capital deployment and support premium returns for operators as regional vacancy rates remain firmly below the 5% threshold.

Exhibit 25: Shortfall across scenarios, 2030E

MW-IT, 2030E	Low	Base	High
Total demand	3,180	5,233	6,957
Deliverable supply	4,469	4,469	4,469
Shortfall	**1,289**	**-764**	**-2,488**
Shortfall as % of addressable demand	41%	-15%	-36%

Exhibit 26: ANZ Data Centre supply shortfall: 0.7GW base case, 2.5GW bull case by 2030E

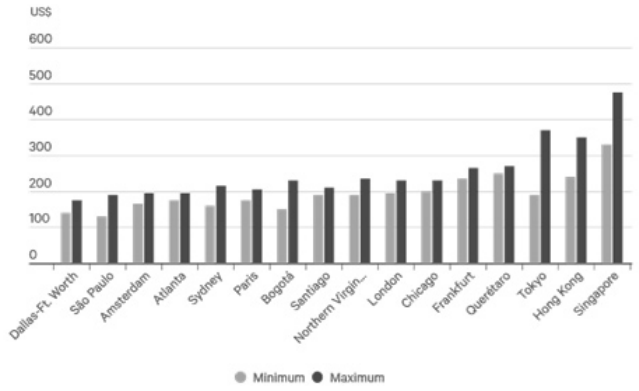

Source: Goldman Sachs Global Investment Research

Based on our channel checks, Australia is approximately three years behind more mature markets. Europe is currently seeing 15% YoY rental growth in primary markets, while the US is recording 10% YoY growth for 2026E per CBRE. We think Australia appears positioned for similar growth as supply-demand imbalances persist. **Sydney currently has relatively low rental rates compared to other primary data center hubs globally, as detailed in the CBRE Global Data Center Trends 2026 report.** Sydney's average monthly rental rate for a 250-500-kW capacity requirement is US$188 per kW/month in Q1 2026. This pricing positions Sydney as a highly competitive market, especially when compared to key Asia-Pacific peers like Singapore (US$403 per kW/month), Hong Kong (US$295 per kW/month), and Tokyo (US$280 per kW/month). It is also lower than major US Tier-1 markets such as Northern Virginia, where monthly rental rates range US$190-235 per kW/month, and Chicago, which saw rates between $US200-230 per kW/month in the same period.

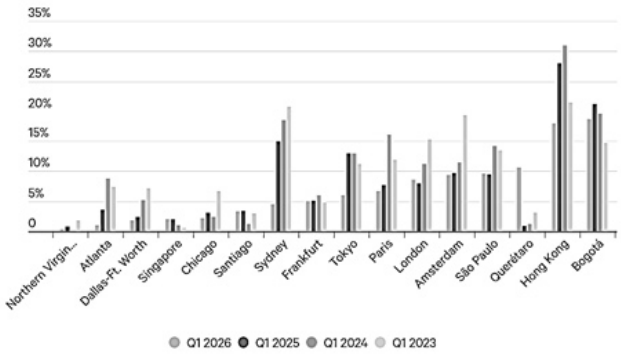

Sydney's vacancy rate sat at a healthy 4.50% in Q1 2026, compared to extremely tight markets like Singapore, which maintained a vacancy rate of only 2% due to limited greenfield pipeline opportunities. While land scarcity and grid constraints are beginning to push developers toward vertical footprints, Australia has a more abundant land footprint than ultra-dense cities like Singapore or Hong Kong. This buffer of available capacity has helped keep pricing stable and prevented the aggressive price spikes seen in more land-and-power-constrained markets.

Exhibit 27: Monthly Pricing for 250-to-500-kW Capacity by Market

Source: CBRE

Exhibit 28: Data Center Vacancy Rate by Market

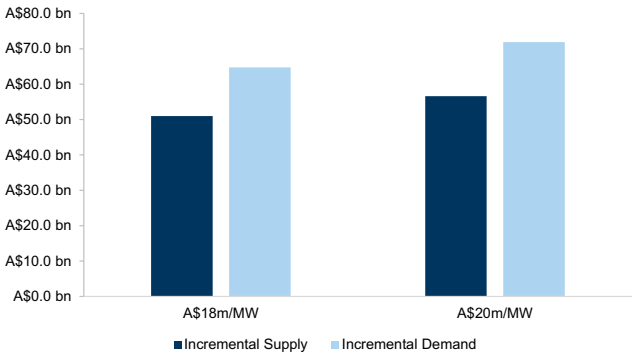

Source: CBRE

5. Data Centre Capex

Traditional data center builds in the US typically cost cUS$10mn/MW (A$14mn/MW) for the core and shell. Build costs in Australia are 25-30% higher than in the US due to significantly higher labor costs and utility connection expenses. Based on coverage company guidance and our recent expert conversations, we estimate build costs of A$18-20mn/MW for next generation AI facilities which require higher power density and advanced cooling, infrastructure capex.

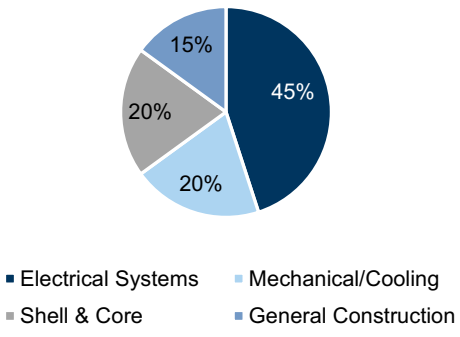

We expect ~A$50-65bn of capex is required to fund supply/demand at A$18mn/MW - excluding IT equipment. Factoring in servers, chips, and high-density hardware, all-in capex scales to A$130–150bn depending on specifications. Industry feedback suggests US hyperscalers are investing in Australia for its regulatory stability, low sovereign risk, and critical subsea links to Asia. As a Five Eyes partner, we believe Australia stands as a primary beneficiary of the severe grid and power bottlenecks currently stalling US data center expansion.

Exhibit 29: ANZ Data Centre - New Capex by 2030

5. Who is best positioned?

Varying operator business models make direct return comparisons across the ANZ data center market complex, though key metrics are as follows:

- **EBITDA Margins:** Our covered ANZ data centers generate healthy margins of 50% to 60% at the group level, matching US peers.
- **Development Yields:** GMG forecasts a 9.2% YOC across its active pipeline, while US peers target higher benchmarks – DLR expects stabilised yields of 10%+ through cycle and Equinix achieves 27% in 2026E (both names are covered by Michael Ng). This yield gap is a function of product mix. Equinix's superior returns are driven by its high-margin, dense interconnection ecosystem, where customers pay a premium to connect directly with one another. In contrast, providers like NEXTDC (10% YOC target) and DigiCo (15% YOC for SYD1) operate primarily as wholesale and hyperscale colocation partners, focusing on high-volume power and space delivery.

GMG (Buy) screens best among our covered ANZ data center names **on scale and pre-secured power, though the exposure is more diluted and further from monetisation.** GMG carries ~A$20bn of development work in progress within an A$89bn managed portfolio and a DC portfolio we estimate is worth A$28bn when contracted. The strategic asset is the power bank: secured grid capacity across metropolitan industrial sites the market spent a decade valuing as logistics land and is now repricing as the scarcest input in the digital infrastructure stack. Earnings leverage converts more slowly than for a pure-play operator, as the power bank requires development, fit-out and lease-up before it prints earnings. We think GMG's equity share of its 6.4GW power bank could be worth A$28bn vs A$11bn implied by the current share price – a ~A$17bn (c.60%) gap central to the investment case.

MP1 (Buy) offers direct exposure to the AI thematic, providing enterprises with full-stack AI infrastructure (network, compute, storage) on a take-or-pay basis with strong unit economics (c.2yr payback) and returns (GSe c.30% levered IRR). MP1 is well funded with pro-forma liquidity of A$362mn (after c.A$1.8bn of FY27E capex), and we expect it to draw on its A$845mn facility to fund new contracts. Its core network business remains robust, with a global footprint that is difficult to replicate without significant time and investment.

NXT (Neutral) has arguably the best operational assets in the sector given their track record of execution, but the highest cost of funding and largest funding shortfall, which is why we place it after GMG. NXT funds a capital programme running at multiples of its EBITDA from a balance sheet with no sponsor and no managed funds platform. When market pricing clears, NXT monetises and captures the economic rent on the capacity it brings online; the core execution risk is that capacity is commissioned later than the forward order book indicates, creating a funding gap.

DGT (Neutral) offers valuation upside through its scarce SYD1 asset in the Sydney CBD and delivered a strong FY26 EBITDA of A$127mn while accelerating its 88MW expansion, but remains small relative to the market opportunity and is divesting US assets to fund local growth.

MAQ (Neutral) is executing well on IC3 SuperWest and has materially de-risked its medium-term growth profile by acquiring a site for the proposed ~200MW METC.

2. The role of Funding in ANZ Digital Infrastructure

As mentioned in section 1, we expect A$52-65bn of supply/demand data centre investment over the next 5 years, excluding IT hardware and server equipment. Access to capital directly translates to speed to market as companies are able to bypass the power bottleneck by funding their own infrastructure or securing long term utilities commitments ahead of competitors. We assess our coverage against four criteria:

- **Capital recycling:** Can the business generate development capital from existing assets rather than new issuance?
- **Third-party capital access:** Is there a managed-funds or sponsor structure that multiplies balance sheet capacity?
- **Self-funding ratio:** What proportion of the funding program can be met from operating cash flow and existing facilities?
- **Dilution risk:** How likely is equity issuance, and at what point in the cycle?

The ranking is not a ranking of asset quality. NEXTDC has arguably the better single-asset portfolio. Goodman ranks first because of its low gearing, ability to intermediate third-party capital into development and a track record of capital recycling. Given the sheer amount of capex required to fund expansion we think ANZ data centre operators must move away from traditional corporate finance models in favor of alternative capital structures.

Below we rank our coverage under a funding scorecard framework:

Exhibit 31: Funding scorecard

Ranking	Company	Capital recycling	Third-party capital	Self-funding ratio	Dilution risk	Cost of Debt	Gearing	Liquidity (A$bn)
1	Goodman (GMG)	Strong	Strong A$75bn platform	Strong	Low	4.6%	19.5%	18.8*
2	DigiCo (DGT)	Moderate	Moderate, sponsor level	Moderate	Moderate	6.0%	18.0%	1.2
3	NEXTDC (NXT)	Limited	Evaluating JVs	Weak	High	6-8%	29.0%	9.8
4	Macquarie Tech (MAQ)	Moderate	Moderate	Moderate	Moderate	5.5-7%	15.0%	0.6
5	Megaport (MP1)	Limited	Limited	Moderate	High	5-6%	10.0%	0.36

*GMG metrics are last reported, whereas other companies have disclosed pro-forma liquidity given announced transactions since 30 June 2026.

Source: Data compiled by Goldman Sachs Global Investment Research

The debate surrounding how to fund this buildout has highlighted several highly viable alternative models:

Debt financing vs. capital recycling has featured in a lot of our industry discussions recently as operators are exploring more options to leverage existing asset books. Data centre operators often use capital recycling – selling stakes in mature assets to fund new developments – to lower their reliance on more expensive corporate debt and manage high interest costs. While Australian debt offers tax-shield benefits, it remains highly restrictive. All-in costs start at 5% for investment-grade issuers and exceed 8% for unrated developers, with capacity strictly capped by gearing covenants that require contracted EBITDA validation to unlock. Conversely, capital recycling avoids coupon obligations but is not free; its true cost is the foregone yield on stabilised cash flows, which range 4.9-5.6% net of transaction friction and any retained operating fee streams.

Third-Party Equity Partnerships and Joint Ventures: Operating an off-balance-sheet or capital-partnered model allows developers to scale capacity rapidly while lowering their look-through weighted average cost of capital (WACC). For example, Goodman Group (GMG) is funding its 0.5 GW global data centre pipeline through structured partnerships with long-term institutional capital and development Partnerships. Similarly, Stockland has formed a 50/50 partnership with EdgeConneX to monetise existing landholdings and share development risks.

Asset-Backed Debt and Large-Scale Private Syndications: Private credit and structured infrastructure debt provide deep liquidity pools that are better suited for asset-heavy development than standard corporate credit. To fund its SYD3 campus in Western Sydney, AirTrunk Pty Ltd raised a A$4.25bn syndicated loan in June 2026, reflecting the appetite for private debt linked to AI infrastructure at that time.

Public Debt Capital Markets and Bond Issuance: For operators with established, cash-generating operational portfolios, the debt capital markets offer an attractive avenue for refinancing and extending debt maturities. Alphabet Inc. successfully priced an inaugural A$5.5bn senior bond issue across six tranches, drawing a final orderbook of A$18bn, which represents the largest-ever corporate bond debut in the Australian market.

Below is a list of the funding profile for the Data Centre players

NextDC

- **Liquidity Profile:** NEXTDC has A$876mn of cash, supplemented by A$7,100mn in undrawn senior debt tranches and A$700mn under its Hybrid Securities B Delayed Draw Series, yielding a pro-forma liquidity pool of A$8.7bn. Subsequent to 30 June 2026, liquidity expanded further to A$9.8bn following the pricing of its A$1.1bn convertible note offering.
- **Gearing & Capital Structure:** NXT has gearing of 11% excluding subordinated capital and 29% including subordinated capital.

Goodman Group

- **Liquidity Profile**: Goodman maintains a strong balance sheet, with A$4.1bn in cash and A$2.3bn of available bank facilities. Total available group liquidity stands at A$6.4bn. GMG has A$12.4bn in available cash, undrawn lines, and equity commitments across its managed partnership platforms.
- **Gearing & Capital Structure:** Direct on-balance sheet gearing is highly conservative at 6.5%. Look-through gearing-which proportionally consolidates the assets and debt of the partnership platform-stands at 19.5%.

Megaport

- **Liquidity Profile:** Megaport has pro-forma liquidity of ~A$0.36bn, according to the company. This follows the late-September 2026 announcement of three milestone AI infrastructure contracts with a combined Total Contract Value (TCV) of ~A$1.0bn and their associated capex. MP1 is fully funded on a pro-forma basis for all committed capital expenditure arising from strategic contracts announced since

September 2026, according to the company. MP1 has an A$845mn debt facility available.

- **Gearing and capital structure:** Last reported gearing is 10%. We expect a greater focus on gearing as MP1 draws down on debt facilities to fund future growth.

DigiCo

- **Liquidity Profile:** DigiCo held A$205.8m in cash as of 30 June 2026, with A$706m in available liquidity. Following the completion of its CHI1 sale, pro-forma liquidity is set to rise to A$1.2bn, delivering approximately A$470m in net equity proceeds.
- **Gearing & Capital Structure:** Post the CH1 sale, net debt will fall to A$0.5bn, and look-through gearing will drop to 18%, well below its 35% to 45% target range. This will provide full funding for SYD1 88MW project.

Macquarie Technology

- **Liquidity Profile:** MAQ reported cash of ~A$5mn at 30 June 2026. Growth initiatives are backed by an undrawn A$496.5mn corporate facility and A$100mn in undrawn Hybrid Series 2 securities.
- **Gearing & Capital Structure:** MAQ has drawn only A$3.5mn from its bank facility, but carries A$93.10mn in CPI-linked loan notes. Currently gearing is approx ~15%.

The Pipeline Funding Gap

To evaluate the balance sheet capacity of key Australian data center (DC) operators and developers, we benchmark current look-through liquidity against near-term and long-term capital expenditure requirements.

Key Assumptions & Methodology Capex Pricing:

- **We assume a baseline construction cost of A$18mn/MW for WIP and A$20mn/MW for future builds.** This reflects some cost inflation across the data center supply chain and assumes development timelines will be staggered over multiple years.
- **Exclusions:** MP1 is excluded from this analysis as they do not construct physical data centers and have recently guided to their pipeline being fully funded.

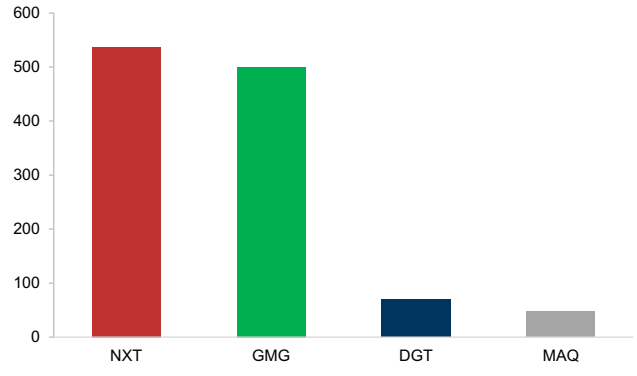

We think WIP is manageable: Active WIP pipelines present relatively minor near-term funding gaps. The primary capital hurdle lies in long-term landbanks. GMG remains uniquely insulated with A$10bn in excess liquidity. While its 5.2GW landbank requires a staggering A$100bn to fully develop, its capital-light, third-party partnership model significantly mitigates direct balance sheet strain.

Exhibit 32: DC Pipeline and Funding required

Company	WIP Pipeline (MW)	Required Capital (A$bn)	Available Liquidity (A$bn)	Funding Shortfall (A$bn)
NXT	537	9.4	9.8	0.4
GMG	500	8.8	18.8	10.1
DGT	70	1.2	1.2	0.0
MAQ	40	0.7	0.6	-0.1

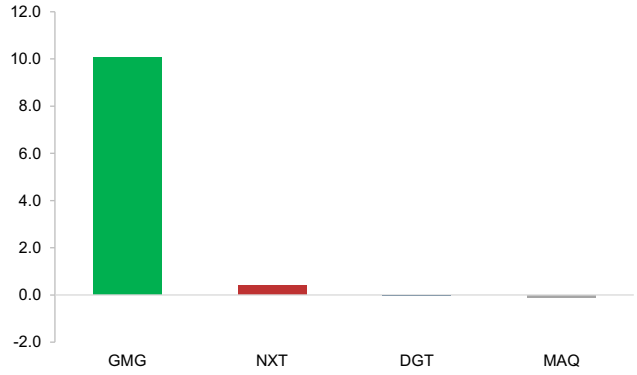

Source: Company data, Goldman Sachs Global Investment Research

Exhibit 33: DC Pipeline (MW)

Source: Company data, Goldman Sachs Global Investment Research

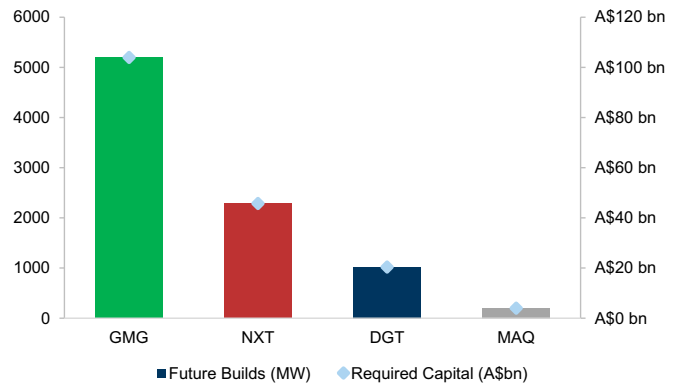

Exhibit 34: Funding Surplus - WIP Pipeline (A$bn)

Source: Company data, Goldman Sachs Global Investment Research

GMG leads the cohort with a substantial future development pipeline of 5,200MW, requiring A$104bn in capital, which is more than double the requirement of any other peer, however the partnership model de-risks this. NEXTDC follows with a highly capital-intensive runway, requiring A$45.8bn to fund its 2,289 MW of future capacity. DGT and MAQ have more targeted expansion profiles, with DGT requiring A$20.4bn to fund its 1,020 MW pipeline and MAQ requiring A$4.0bn to complete its 200 MW of future builds.

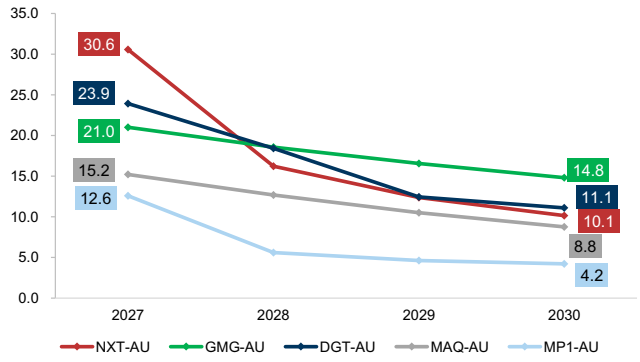

Exhibit 35: Future builds vs required Capital (rhs)

Source: Company data, Goldman Sachs Global Investment Research

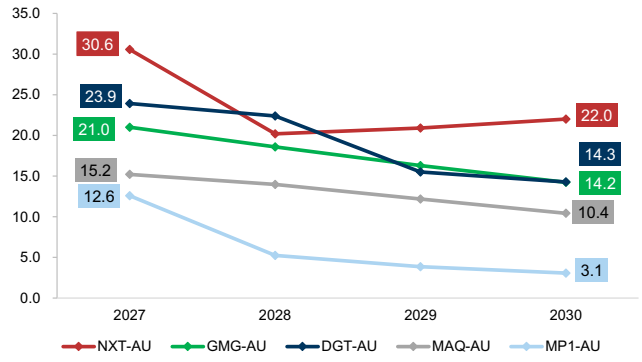

We think the funding debate is a critical driver of trading multiples across the data center sector. As operators contract new capacity and scale their EBITDA, we observe substantial multiple compression over time when analysed under a static Enterprise Value (EV) framework. However, this compression is significantly overstated; adjusting EV on a rolling basis to account for anticipated capital expenditures and incremental net debt yields a far more stable and realistic valuation trajectory. To illustrate, under a static EV model, NXT's 12-month forward EV/EBITDA multiple compresses aggressively from 31X today to just 10X by FY30E. In contrast, when dynamically rolling the EV to incorporate annual capex and adjusting net debt on an annualised basis, the multiple compresses far more moderately, declining from 31X to 22X over the same horizon.

Exhibit 36: Consensus EV/EBITDA pricing shows significant earnings growth into FY30E

The Strategic advantage of Capital Recycling

GMG serves as the primary benchmark for asset-light infrastructure development, managing a network of 26 Partnerships with 55 institutional investors. Under this model, the majority of Goodman's assets reside off-balance sheet within these Partnerships, which hold A$75.4bn in external Assets Under Management (AUM) as of 30 June 2026. This model was illustrated in December 2025, when Goodman established an A$14bn European Data Centre Development Partnership (GEDCDP) with the Canada Pension Plan Investment Board (CPPIB). The 50/50 partnership secured an initial capital commitment of A$3.9bn (€2.2bn) to construct 435MW of primary power capacity across major Tier 1 European markets, completely de-risking early-stage development while utilising CPPIB's deep institutional liquidity.

Recycling capital has no coupon but it is not free capital as the cost is the stabilised income given up when an asset is sold or syndicated, net of transaction costs and net of any fee stream retained on the third party money introduced. Nor is it simply the exit cap rate, because a platform operator gets paid to manage the capital it places. Three differences matter more than the headline rates. Debt adds leverage and risk to the residual equity while recycling deleverages. Debt capacity is covenant bound while recycling capacity depends on institutional appetite and can be repeated. And debt interest is deductible while surrendered rent is not, so a pre-tax comparison flatters recycling and a post-tax comparison largely closes the gap.

On our illustrative build, recycling through a fee platform prices at about ~4.9% pre-tax vs 5.5% for institutional debt - a ~60bp saving, and +200bps savings against unrated and hybrid debt a pure-play developer would otherwise draw on. The material conclusion is that a developer with a managed funds platform can fund its program at a materially lower blended cost than one without, and can keep doing so after a balance sheet lender would have stopped. The mechanism is visible in the worked example below:

Exhibit 38: Capital Recycling worked example

Step	Illustrative	Notes
Stabilised asset value	A$1,000m	Post lease-up, contracted
Exit cap rate	5.50%	Implies A$55m stabilised NOI
Interest syndicated to third parties	75%	A$750m gross proceeds
Co-investment retained	25%	Income share not surrendered
Transaction costs at 1.25%	(A$9.4m)	Stamp duty, advisory, legal
Net capital released	**A$740.6m**	
Income surrendered (75% × A$55m)	A$41.3m	The true economic cost
Less base mgnt fee, 50bp A$750m	(A$3.8m)	Annuity on third party AUM
Less development and leasing fees	(A$1.5m)	Illustrative
Net annual cost	**A$36.0m**	
Cost of recycled capital	**4.86%**	A$36.0m ÷ A$740.6m
Transaction without a fee platform	*5.57%*	A$41.3m ÷ A$740.6m

Source: Company data, Goldman Sachs Global Investment Research

We believe GMG (Buy) is best placed on funding given it does not have to own all the capital it deploys. Goodman originates, develops and then places assets into managed partnerships funded by third-party institutional capital, retaining a co-investment stake and an annuity management fee. Development capacity is therefore a function of investor appetite for stabilised digital infrastructure, which is currently deep, rather than of Goodman's own gearing capacity.

We think NEXTDC (Neutral) has the strongest case for recycling in the coverage set because it has the widest gap between opportunity and funding capacity.

Three options are available, in ascending order of value:

- **Option A** – syndicate stabilised assets. S1, S2, M1 and the mature Brisbane and Perth facilities are contracted, stabilised and institutionally financeable. Syndicating a 75% interest at a 6% cap releases capital at an opportunity cost 5.57%, which is cost effective vs. incremental debt/notes that are being signed at 7%+.
- **Option B** – syndicate the land bank. S4 and S7 are consented, grid-adjacent and produce no income. Bringing a capital partner in at pre-development surrenders no current NOI and lets NEXTDC earn a development fee on the partner's capital.
- **Option C** – establish a development fund. A managed vehicle with institutional partners funding the pipeline, with NEXTDC earning base, development and leasing fees and retaining a co-investment stake. This is the Goodman model applied at a fraction of the scale, and would lower NEXTDC's marginal funding cost from 7% to below 5% – a potential saving of +200 basis points.

3. Comparing traditional DC vs AI factory metrics in detail

We compare and contrast traditional data centres with AI factories to sharpen our understanding of Megaport's positioning within the emerging AI compute ecosystem, and to examine the unit economics, returns and equity value generated by new contracts in greater detail. On the basis of this analysis, we believe Megaport represents the most compelling way for investors to play the AI thematic on the ASX.

An introduction to GPUaaS, Neoclouds & AI Factories

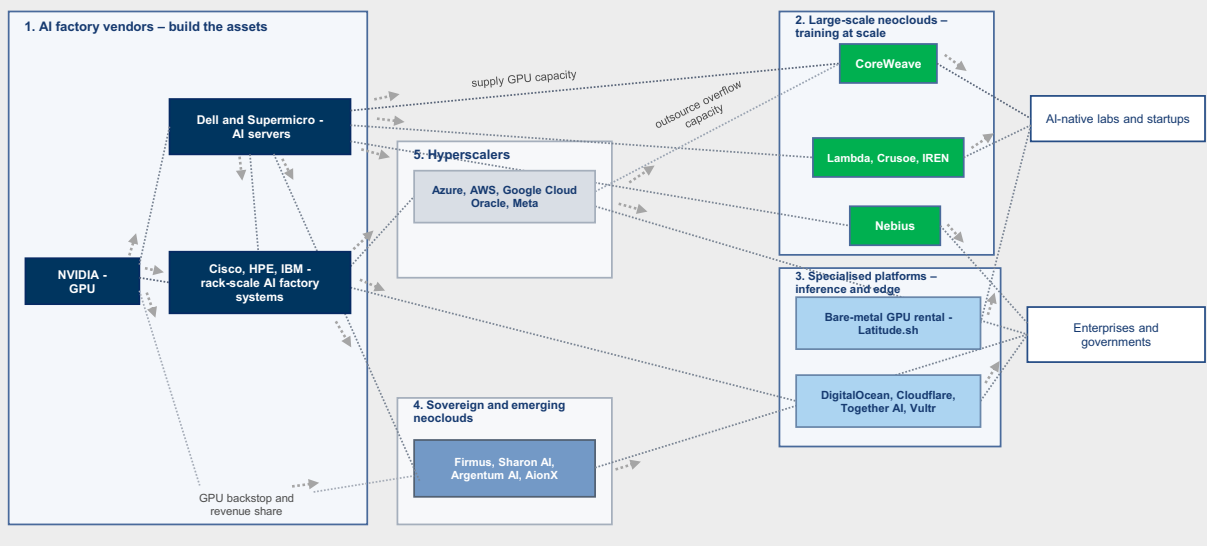

GPU-as-a-Service (GPUaaS) is where consumers rent GPU compute over the cloud to run AI training and inference workloads. These AI servers require significantly more power than traditional data centre server racks and involve greater power provisioning and hardware maintenance. As a result, GPUaaS offers customers operational and technical expertise, economies of scale, and compute flexibility without incurring significantly high upfront capex associated with this hardware. GPUaaS expands across several business models, with examples including large-scale neoclouds, and specialised GPU rental platforms (i.e. bare-metal through Latitude.sh).

Moreover, **neoclouds** are a subset of GPUaaS – independent GPU cloud providers such as CoreWeave and IREN that offer on-demand access to leading edge compute infrastructure tailored for AI workloads. Neoclouds differ from hyperscalers given their contractual flexibility (shorter contracts) and singular focus on providing capacity – however, the neocloud market structure is highly fragmented and subscale. Currently, we estimate neocloud capacity represents <5% of the total compute market; however, we see opportunity for margin expansion, operating leverage and market consolidation as the industry matures.

An **AI factory** is the asset built and/or acquired by neoclouds where data is turned into intelligence to drive decision-making. For vendors it represents pre-built, full-stack systems sold to neoclouds and enterprises at higher margins than standalone GPU servers.

Below in Exhibit 39 we highlight the emerging AI compute ecosystem: (1) AI factory vendors; (2) large-scale neoclouds; (3) specialised inference and edge platforms; (4) sovereign and emerging neoclouds; and (5) hyperscalers.

Exhibit 39: Emerging AI compute ecosystem

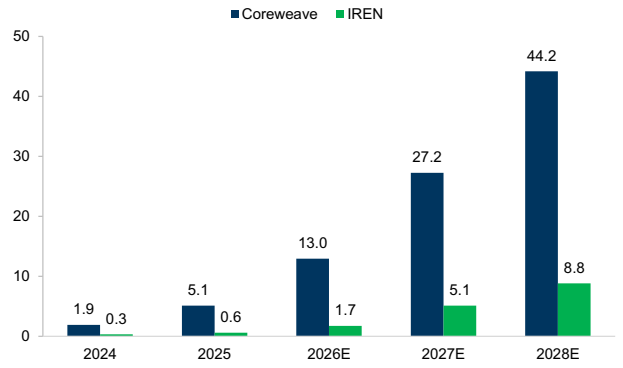

This simplified schematic is intended to show the relationships between different types of company within the ecosystem. Company names are not exhaustive.

Source: Data compiled by Goldman Sachs Global Investment Research

Examples of Neocloud & Specialized AI platforms

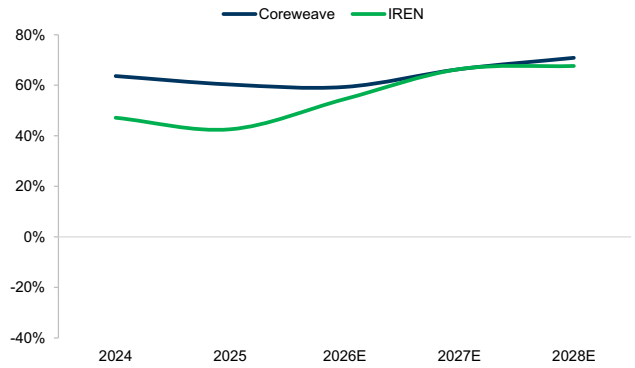

- **CoreWeave (CRWV, covered by Gabriela Borges):** largest pure-play GPU cloud, heavily concentrated in a few very large contracts with Microsoft, OpenAI and other frontier labs. CRWV achieves 25% contribution margin for operating GPU clusters, and signed 2Q26 contracts with 5-10ppts higher CM. CRWV has 98% of revenue in multi-year take-or-pay contracts with a cUS$104bn backlog and no upward pricing elasticity, with significant balance sheet debt (cUS$35bn).
- **IREN (IREN, covered by Michael Ng):** Australian-founded, pivoted from bitcoin mining to AI cloud services. For its US$9.7bn AI cloud partnership with Microsoft, IREN expects 85% project EBITDA margin once all four phases are operational.
- **Lambda:** privately held, developer-first US GPU cloud with dual-channel reach, selling both on-demand cloud capacity and physical GPU servers and workstations to ML teams. Lambda reportedly signed a US$35bn cloud-computing agreement with Anthropic to power a Texas DC.
- **Vultr:** extended general-purpose IaaS into GPU compute using both NVIDIA and AMD silicon, competing on footprint breadth rather than frontier-scale clusters.
- **Latitude.sh (Megaport):** Latitude.sh is a bare-metal and GPU infrastructure provider that plugs into Megaport's network connectivity fabric. Megaport is targeting c2yr payback periods on its full-stack AI infrastructure contracts.

Comparing key metrics of traditional DCs vs. AI factories

AI factory vs Traditional DC. Unlike traditional DCs which were designed to host general-purpose compute with predictable and low density power requirements, AI factories are purpose-built to support the AI model lifecycle, which ranges from training to high-volume inference workloads. AI factories are formed by the combination of 5 key layers – energy, chips, infrastructure, models and applications – into a system to support demand for agentic/physical AI and high-performance compute (HPC).

This drives a step change in physical and capital requirements. Legacy halls were typically designed to be c5-10MW per rack and air cooled – however, modern compute workloads are now driving racks closer to 1-2MW. As a result, operators are focused on developing new cooling mechanisms such as direct to chip closed loop liquid cooling systems.

Comparing the economics. In Exhibit 44 we compare key metrics and make the following observations: (1) AI factories have significantly higher capex vs traditional facilities (A$35-70mn vs. A$15-20mn) which funds higher net revenue (A$29-36mn vs.

A$2.8-4.5mn) and EBITDA (A$22-27mn vs. A$2.1-3.3mn); (2) AI factories have a higher yield on cost (30%+ vs 10-15%) and IRR (25-35%+ vs. 11-20%); (3) On an EBIT margin basis (after accounting for significant depreciation of AI factory GPUs) we estimate EBIT margins of 30-35% vs 50-55% for traditional DCs; (4) Despite stronger returns, the average tenor of a neocloud contract is typically 4-6 years compared to hyperscaler contracts at 10-20 years; (5) The main near-term concern for AI factories is technology obsolescence and contract renewal risk, whereas for traditional DCs risk is skewed to oversupply which would drive downward pricing pressure.

Exhibit 44: We compare ANZ DC vs. US AI factory industry benchmarks across a range of metrics

Metric	ANZ data centre	US AI factory	GS comments
Net revenue (A$mn/MW)	2.8-4.5	29-36	Trad: NXT A$2.8mn/MW, DGT SYD1 cA$4.5mn/MW AI: IREN US$20-25mn/MW (A$29-36mn)

Leasing DC capacity to a hyperscaler vs neocloud

Our analysis below evaluates the earnings and return uplift for a traditional DC if it sold excess capacity to a neocloud vs a hyperscaler. The case assumes a 100MW lease built at A$17.5mn/MW capex, A$2.7mn/MW Year 1 EBITDA, a 2.5% p.a. escalator over a 15yr deal, discounted at 8% with a 20% residual value at end of contract. The neocloud case assumes the same megawatt sold at a 35% EBITDA premium (in-line with rental wholesale rates), 2.5% escalator, 15yr contract (assuming it's an anchor tenant) discounted at 12.0% WACC with a 35% residual value at end of contract. We use a 400bps higher WACC for neocloud leasing given lower earnings visibility, higher customer risk given counterparty/contract renewal concerns. We then scale the two scenarios across 100MW of leaseable capacity and test sensitivity.

Key finding: Selling capacity to a neocloud generates a stronger IRR of 22% compared to 16% for a hyperscaler. More importantly, the neocloud advantage holds after the 400bps risk premium, which we believe shifts the investment debate onto re-contracting risk. As a result, DC operators can maximise their risk-adjusted returns by selling excess capacity (c10-20%) across their DC portfolio to neoclouds and achieving a blended IRR of 16-17% (vs 15.7% previously). We summarise further takeaways below:

1. **Selling excess capacity to a neocloud drives a significant improvement in yield on cost, where year 1 YOC re-rates from 15% to 21%, given capex has already been spent.**

2. **Even after adjusting neocloud returns for a higher cost of capital (12%) vs leasing to a hyperscaler (8%) the IRR spread over each project's own cost of capital is 1,017bps for a neocloud vs 773bps for a traditional lease.**

3. **Data centre operators would benefit from leasing out excess capacity to drive stronger shareholder returns on a risk-adjusted basis.** We note that the 22% IRR (vs. 16%) does not require any material changes in capital intensity. However, if DC operators chose to sell GPUs and capacity to neoclouds, it would significantly increase capital intensity, earnings trajectory; however, the operators would bear the risk of holding GPU inventory on hand (and its rapid depreciation).

Exhibit 47: DC operators receive c35% rental premiums for neocloud customers vs hyperscalers

Inputs	Hyperscaler lease	Neocloud lease
Capex per MW (A$mn)	17.5	17.5
Year 1 EBITDA/MW (A$mn)	2.7	3.6
Annual EBITDA escalator (%)	2.5%	2.5%
Contract term (years)	15	5*
Discount rate (WACC, %)	8.0%	12.0%
Terminal value (% of capex)	20%	35%

**assumes contract renewals in-line with industry*

Case Study: Comparing NXT vs MP1 equity value uplift and IRR from like-for-like new contracts

Our below analysis evaluates the equity value uplift and IRR from a single contract at each company, normalized so that both generate cA$260mn of EBITDA in yr1. NEXTDC assumes a 100MW contract win at a 15% YOC with 2.5% p.a. contract escalators over a 15yr contract. Megaport assumes a full-stack contract win (network, compute, storage) at the same EBITDA of cA$260mn (implies cA$525mn ARR at 50% margin), 2yr payback period and 5yr contract, priced with no escalators. We model under three scenarios: (1) 100% debt funded; (2) 100% equity funded; and (3) 50/50 debt/equity. We assume an 8.5% cost of equity, 7.0% pre-tax cost of debt and 30% tax rate.

Key finding: Megaport generates materially higher equity value uplift and IRR per dollar of capital deployed vs NEXTDC. As a result we believe MP1 investor focus shifts to contract renewal probability versus funding source for NXT, where debt-funded growth has stronger returns vs equity. We summarise further takeaways below:

1**. Both contracts create equity value under all three funding structures** – however, Megaport does so with a far wider margin of safety. MP1's project IRR of 31% significantly exceeds its cost of equity by >22pts, compared to NXT's 11% IRR vs an 8.5% cost of equity.

2. **MP1 delivers approximately 8x the equity value per dollar of capital deployed versus NXT.** On a 100% equity value basis (scenario 2) MP1 creates cA$0.7 of equity value per A$1 of capex compared to NXT at A$0.1, largely underpinned by NXT's wider capex intensity of c3x (NXT cA$1.8bn, MP1 A$525mn).

3. **NXT's value proposition relies on its contractual indexation and high-quality counterparties over long duration contracts.** The 2.5% escalator lifts EBITDA in yr15 to cA$370mn (21% exit YOC) and lifetime EBITDA of 2.7x - slightly ahead of MP1's 2.5x. However, if we strip out contractual escalators our estimates imply a negative equity value for NXT.

4. **Time to cash is the structural divide across these contracts.** Megaport recovers its capital in 2yrs, which can then be recycled a few times before NXT recovers its capital in 7yrs. As a result, we see scope for NXT to boost equity returns through capital recycling.

5. **We believe MP1 investor focus shifts to contract renewal given superior equity returns per dollar of capital deployed.** We are confident MP1 can renew contracts given CRWV recent contract renewal for A100 chips which implies a total 9yrs of useful life. Otherwise, in the case MP1 cannot re-contract chips to the existing customers, the following options are available: a) offer latest kit with new contract; b) sell old kit on secondary market at spot rate; c) keep GPU and run inference services; d) use older kit for virtual machines.

Exhibit 50: We compare key return metrics for NXT vs MP1 assuming comparably sized contracts (i.e. 100MW equivalent to A$525mn ARR for MP1). We find that MP1 is more efficient in generating equity value per dollar of capital deployed regardless of capital source

Financial inputs	NEXTDC (NXT.AX)	Megaport (MP1.AX)

Demand, rental rates and useful life of GPU/CPUs

In recent months, we highlight that GPU rental rates have seen significant upside pricing pressure (US$/hr) despite broader marker concerns on the reliability of AI capex spend. We highlight recent pricing data points:

- Nebius raised GPU cloud service price by an average of 20% from October 1, and noted continued strong AI compute demand and tight supply. The company is also seeing payback periods fall from 3 years pre-IPO to as little as 22 months in some cases.
- **IREN** seeing GPU lease pricing robust, with three year deals priced at US$20-25mn/MW, and shorter (<1year) contracts priced at US$40mn+/MW.
- **NVIDIA** reiterated its 70% revenue growth target for CY27 despite supply tightness, and reiterated total AI infra spend to be US$3-4tr by 2030.
- **CoreWeave** noted enterprises increasingly treated AI infrastructure as a strategic asset and are building dedicated AI clusters for training and inference workloads (i.e.

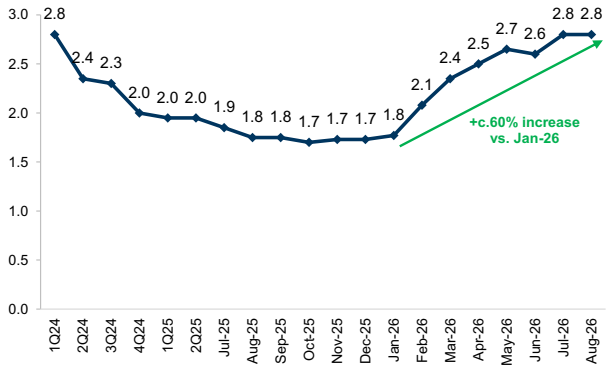

Caterpillar). CoreWeave recently renewed a A100 contract which implies a total useful life of c9yrs, well above 4-6 industry averages. For more recent GPUs, CRWV increased useful life to 6yrs vs 5yrs previously.

Comparing data centre cap rates across developers, operators and neoclouds

The 5% to 10%+ yield range reflects risk transfer rather than differences in asset quality. GMG's stabilised portfolio carries a 5% WACR against NEXTDC's independently valued operating assets at 6-6.25%. Both hold institutional-grade assets leased to hyperscale tenants – the differential reflects who retains residual risk. Goodman syndicates or divests completed assets – around 90% of projects under construction sit in JVs with sovereign wealth and pension capital – and retains the development margin. NEXTDC retains the asset, the operating obligation and the tenant concentration, with its top two hyperscale customers at 51% of FY26 revenue.

Developer returns sit in the spread between build yield and exit cap rate. Goodman is underwriting 8.2% YOC across a A$19.7bn WIP pipeline, rising to 9.2% on FY26 commencements against a 5% stabilized book. Sector-wide, development yields have moved from the historic mid-8% range to 10-10.5% driven by power scarcity rather than capital or chip availability. Exiting at a 6-6.5% stabilized cap rate implies a 350–400bp spread, captured without exposure to the compute layer – developers deliver the shell and leave hardware and power standard risk with the tenant over a ten-year-plus horizon.

Neoclouds are more appropriately assessed as credit exposures. A shell costs A$15-20mn per megawatt, fully fitted AI capacity reaches A$50-100mn, with up to 80% in hardware carrying a 4-7yr life against a new generation roughly every 18 months, vs 20-30yr lives for passive real estate. Pricing therefore tracks collateral quality rather than sector, ranging from secured GPU-backed debt at SOFR + 250bps to unsecured high yield at 9-15%. Two caveats to note: (1) Microsoft has accounted for approximately 65-67% of CoreWeave revenue, and (2) a material share of sector credit quality derives from NVIDIA support via equity, guarantees and chip allocation. On this basis, stabilized assets for duration, developers for spread, neoclouds underwritten on credit fundamentals.

Goodman Group (GMG.AX): Data Centre opportunity underappreciated, Initiate at Buy

i) Investment Thesis and Valuation

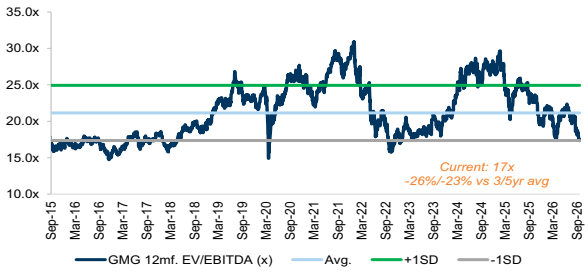

Goodman Group (GMG.AX) owns, develops, and manages high-quality industrial properties and digital infrastructure in major global cities. Our positive outlook is driven by three key factors:

1. **Strategic Land Bank & Aligned Management:** GMG's portfolio focuses on high-barrier-to-entry urban locations. Management has a proven track record of disciplined capital allocation, with executive incentives closely aligned with shareholders interests through co-investments and long-dated equity.
2. **Core Industrial Growth:** Structurally tight vacancies in infill markets, positive rental reversions, and a constrained development pipeline support steady income growth. Additionally, an easing interest rate environment provides a tailwind by compressing cap rates and reactivating third-party capital.
3. **Data Center Accelerator:** Backed by a secured global power bank, Goodman's expanding digital infrastructure pipeline serves as the primary catalyst for development earnings and external AUM growth over the medium term.

Valuation: We derive our 12m TP of A$32 for Goodman using an FY27 EV/EBITDA based approach consistent with our offshore counterparts and across our coverage. We use a 21X multiple, in-line with global DC/industrial peers. We cross-check our valuation by modeling what we think GMG's DC valuation could be worth. We think GMG's equity share of its 6.4GW power bank could be worth A$28bn, against an estimated A$11bn implied by the current share price - an ~A$17bn (c.59%) gap, which we see as the core of the investment case.

Exhibit 54: We value GMG at A$32/share using a 20X multiple, in-line with global DC peers. We also run a scenario analysis to ascribe value for GMG's DC power bank, which implies a -59% discount vs our valuation

ii) Financial Forecasts vs. consensus
Where we are different to consensus?

Revenue: We forecast FY28/FY29 net revenue of +1%/+2% above consensus. Total Work in Progress (WIP) rose 53% to $19.7bn in FY26, with data centers now accounting for 78% of that book (~$15.4bn). Critically, 71% of active WIP is pre-sold or developed for Partnerships, meaning revenue recognition tracks construction progress rather than speculative leasing. The 6.4 GW power bank (3.6 GW secured) de-risks the workbook, and we expect 0.5 GW of powered shell and fitted product to become income-producing earlier than modeled. Growth is further supported by the €8bn European development partnership and new hyperscale leases in Tokyo and Los Angeles.

Operating EBIT: We forecast FY28/29 EBIT +1%/+2% above consensus. Consensus models development spread normalisation. Yield on cost in WIP rose to 8.2% from 7.5% in FY26, and FY26 commencements were struck at 9.2%. Fresh inventory is entering the book at a spread 100bp above the blended average, which means the WIP-weighted yield mechanically lifts beyond FY27. The second lever is the fee line, where the base for performance fees is unusually soft: performance and transaction income fell 44.6% to $206.2mn in FY26 on partnership assessment timing, against a Partnership AUM base that has grown to $75.4bn (average stabilised AUM $68.7bn). Management services revenue of $483.9mn (+4%) scales against employee expenses of $180.8mn across 26 partnerships leading to high incremental margin.

EPS: We forecast FY28/29 +1.9%/+2.6% above consensus. Management have a track record of setting conservative guidance. GMG now capitalises more of its interest cost into projects under construction (A$110.3m at Group, up from A$90.3m), which keeps interest out of earnings, but this only lasts while new projects keep starting, so our above-consensus FY28 EPS really depends on the development book staying full rather than on the accounting.

iv) Catalysts and Key Risks

Catalysts

- Finalisation of Australian Data Centre Partnership in 1H27.
- Lease signings, hyperscaler contracts and partnership sell-downs will determine whether earnings growth converges toward the medium-term pipeline's implied trajectory.
- Execution on pipeline of negotiations across Los Angeles, Hong Kong and Amsterdam.
- Operational Shifts: GMG is increasingly focusing on data center solutions rather than just powered shells, with plans to operate some facilities directly for customers.
- Industrial Automation: Beyond data centers, increased industrial development opportunities are expected in FY27 as customers invest in large-scale facilities capable of supporting full robotics and AI-enabled operations.

Key Risks

- **Cyclicality of real estate values.** GMG derives a large portion of operating income from its funds management fees and these are largely tied to the market value of its assets under management (AUM). Therefore, a decline in asset valuations could negatively impact its earnings and overall profitability.
- **Development risk.** A number of factors could impact GMG's development earnings and pipeline such as a change in the level of tenant demand for development product, changes in rental income or development margins (impacted by historical land cost, softening of industrial cap rates or construction cost inflation). Additionally, lower-than-expected contributions from development completions could provide downside to our assumed rate of AUM growth.
- **Ability to attract third party capital.** A decline in GMG's ability to attract and retain third party capital to invest in property assets and its development pipeline could potentially impact overall AUM growth, which would impact our estimates.
- **GMG's ability to restock its development pipeline.** GMG generates a material earnings from its development business. An inability for GMG to restock its development pipeline or to source potential development sites at favourable pricing could impact its future earnings (and margins) from this segment.
- **Retention of key personnel**. We note the potential key person risk as well as GMG's approach of incentivising personnel based on stock-based compensation (which is not reflected in Operating Profit). In the scenario that there is a softening in GMG's stock price, it may be required to increase its cash based (i.e., expensed) compensation to retain and reward staff, which could translate to lower-than-expected earnings and EPS.

Megaport (MP1.AX): Full-stack AI infrastructure with strong economics and returns; Initiate at Buy

i) Investment Thesis and Valuation

Megaport (MP1.AX) is a global automated infrastructure platform, providing enterprises with private network, compute and storage on demand. Our positive view on Megaport is based on the following three drivers:

1. **Significant global network footprint and entrenched ecosystem position.** MP1's fabric is its competitive moat, globally embedded across carrier-neutral data centres with direct on-ramps into all major hyperscalers - which cannot be replicated at scale without significant time and investment.
2. **Stable, high-margin core subscription business that self-funds its growth.** The company's interconnection business generates recurring, contracted revenue at high gross margin, spread across a diversified enterprise base with low concentration. Incremental revenue lands on a largely fixed network cost base, driving significant operating leverage with limited additional capex - and generates cash flow that funds the expansion set out below.
3. **Accelerating full-stack AI infrastructure expansion, with strong economics and returns.** MP1's ability to sell network, compute and storage as a single integrated stack uniquely positions the business to win AI training and inference workloads. Although the build is capital intensive, contract economics are compelling - take or pay contracts with c2yr payback period. We also see upside scope for MP1 to sweat the useful life of its GPU/CPU fleet beyond the initial contract term, supporting strong returns on capital deployed.

Valuation: We derive our 12m TP of A$25.90 for Megaport using an FY27E EV/EBITDA based approach, consistent with our US counterparts coverage. We use a 18X multiple, in-line with global peers. We cross-check our valuation with our DCF, that derives a A$23.30 valuation.

Exhibit 57: We value MP1 on a A$25.90 12m TP

ii) Financial Forecasts vs. consensus

Where we are different to consensus?

Revenue: We forecast FY28-29E group revenue +15% above consensus. For MP1's core network business we sit broadly in-line with the street given the highly visible and contracted nature of revenues. We differentiate vs consensus on compute revenue, where we sit +22% ahead of the street driven by 10% underlying HoH growth and our assumption MP1 wins a full-stack AI contract of at least A$300mn ARR over the NTM (<50% size of new contracts won over LTM). We believe pricing in a contract win (and associated capex on a 2yr payback) remains a reasonable assumption given A$2.3bn TCV of new contracts have been won in under 12mths of ownership despite the business bootstrapped of capital previously.

EBITDA: We forecast FY28-29E EBITDA +9% to +10% above consensus. With our above the street revenue forecasts, we do expect higher S&M and GTM cost to support this growth. As a result, we expect margins to be slightly below consensus on FY28E (-302bps at 53%) but expect this to improve into FY29E (-242bps to 55%).

NPAT: We forecast NPAT -9% to +5% vs consensus. Our below consensus NPAT in FY28E is driven by higher D&A (we assume 5yr useful life for GPU/CPUs) and net interest expense (we expect MP1 to draw down on more debt as it funds future growth). Similarly, in FY29E, we expect higher D&A.

Capex: We forecast FY28-29E capex +174% to +4% vs consensus. Given we expect MP1 to win at least A$300mn of ARR, we expect capex spend of A$600mn to fund these chips largely landing in FY28E. On the core network business, we expect c25% capex ratio on a go forward basis.

Exhibit 59: Our MP1 EBITDA estimates sit ahead of the street

iv) Catalysts and Key Risks

Catalysts

- **Spot GPU and CPU rental rate trajectory.** We continue to track the rates at which spot GPU and CPU capacity is being priced as a direct read on revenue per unit and margin durability.
- **Ramp of ~A$2.3bn in new contract TCV**, with cA$1.3bn reaching full run-rate between Dec-26 and early Jan-27, followed by another cA$1bn by 4Q FY27.
- **Potential new contracts.** We price in A$300mn of AI full-stack new contracts into our base case forecasts - incremental wins beyond this are not in our numbers and represent upside risk to our forecasts.
- **GPU pool procurement and deployment.** MP1 expects the replenished GPU pool to be procured and deployed by 4Q FY27, with revenue expected to ramp in 1H FY28.
- **Potential acquisition of a US-based network and security technology company**, currently in management due diligence with the target complementary to MP1's core interconnection business, per the company.

Key downside risks

- **AI sentiment.** Megaport is levered to the AI trade, and therefore a shift to more negative AI sentiment could impact the multiple even if delivery holds up. Changes in AI sentiment can be driven by: i) higher than expected capex spend; ii) structural changes in regulation limiting growth optionality for AI-exposed companies; and iii) lack of visibility on AI return profile.
- **Supply chain constraints.** Securing the necessary hardware has been challenging for the broader industry more recently. Any slippage in procurement pushes out deployment and therefore delays the revenue ramp. This risk is amplified for Megaport as an owner-operator of its network infrastructure.
- **Contract renewal risk.** Contract renewal is where pricing power gets tested. If churn picks up or pricing resets lower on the bigger cohorts, the recurring revenue base looks less durable than it does today, and it's usually the largest customers with the most leverage to push back. This would drive multiple downside pressure for MP1 if it fails to renew its full-stack customers.
- **Disintermediation risk.** The long-term bear case for MP1 is if hyperscalers build native connectivity, or customers go direct and bypass the middle layer. MP1's whole value proposition is the neutrality it offers, where no single cloud provider can credibly sit in the middle layer of a multi-cloud setup - however this risk increases particularly if the market consolidates.
- **Securing land, space and power ahead of the GPUs.** Capacity needs to be locked in before the hardware arrives. Where the two fall out of sequence, MP1 risks taking delivery of high-cost, short-lived units into sites that are not yet ready to run them, leaving expensive assets idle and utilisation tracking well below plan. Power, rather than land, is the binding constraint in practice, with grid connection queues in key markets running to multi-year lead times and largely outside management's control.

NEXTDC (NXT.AX): Strong contracted pipeline, but funding the focus; Initiate at Neutral

i) Investment Thesis and Valuation

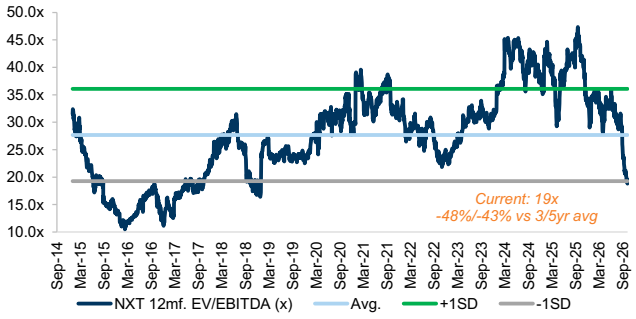

NEXTDC is an Australian owner, developer and operator of high-performance colocation data centres, serving hyperscale cloud providers, enterprises and government across a national footprint of interconnected facilities. Ourview on NEXTDC is predicated on three considerations:

1. **Structural demand is intact, but is now the consensus view.** Enterprise cloud migration continues to compound, and the ongoing evolution of AI is increasing high-density capacity. Contracted revenue and a sticky customer base underpin a proven and profitable operating model.
2. **Funding is the handbrake on growth, not demand.** The binding constraint on NXT is no longer whether the capacity can be leased - it is the cost, availability and dilution associated with financing the build. At A$20/MW build costs, we estimate a funding shortfall of A$1bn for WIP and >A$40bn for full landbank.
3. **Execution, timing and concentration temper earnings visibility.** Contract timing remains the principal swing factor on near-term forecasts, and a small number of large customers account for a meaningful share of contracted capacity. Competitive supply additions, power and land constraints, and the risk of cost or schedule overruns on new sites further widen the distribution of outcomes around our base case.

Valuation: We derive our 12m TP of A$11 for NEXTDC using a 22x FY29 EV/EBITDA (discounted at 9.0%) based approach which is a 40% premium vs coverage list, in line with NXT trading premium over time. We use EV/EBITDA methodology, which is consistent with our US counterparts coverage. For context, NXT EBITDA 3YR CAGR is 74% (FY26-29) vs peer-set average around 12% - justifying the premium multiple. We cross-check our valuation with our DCF (8.8% WACC) that implies an A$11.4 valuation. We would prefer greater clarity on the funding path before becoming more constructive.

Exhibit 61: We value NXT at A$11/share using a 22X fwd multiple

ii) Financial Forecasts vs. consensus
Where we are different to consensus?

Revenue: We forecast FY28/FY29 net revenue of -1%/-2% below consensus. We do not dispute the demand as NXT currently has a 565MW pro forma forward order book at 3.2x current billing utilisation of 175MW. Our variance is entirely about the conversion function: what fraction of the 197 MW scheduled to convert in FY27/28 actually invoices in FY27/28, at what revenue per MW, and what it costs to carry the infrastructure in the interim. Revenue guidance from NXT also implies structural hyperscale price dilution as longer term deals are being signed at lower rates per MW.

EBITDA: We forecast FY28/29 EBITDA -3%/-5% below consensus. The shift to hyperscale is structurally dilutive in the near term. While legacy colocation delivered premium margins at near-zero lag, hyperscale requires staffing and cooling capacity well ahead of the billing ramp. Facility and corporate costs rose 17% in FY26 to support 400 MW+ of upcoming capacity, yet consensus requires a 200bp margin expansion during this transition. We model Net Revenue/EBITDA margin of 68% vs. consensus of 70% in FY28E to account for this.

NPAT / EPS: We forecast FY28/29 NPAT -A$61mn/-A$137mn below consensus. NXT is loss making over our forecast period (FY27-29E) as we forecast net interest expense of A$466-653m for FY28-29E. Reported profits are currently masked by accounting treatments. FY2026 statutory NPAT benefited from an A$128.8 million non-cash fair value gain, whereas the result was an underlying loss on a historical cost basis. Capitalised interest has also become a dominant swing factor, rising 3.2x to A$96.4 million in FY2026-equal to 39% of EBITDA. As S4 and M3 commission, these capitalised costs will convert into depreciation and cash interest simultaneously, creating a drag before billings reach steady state. Furthermore, while A$1.1bn in convertible notes settled in September 2026 provides liquidity, it trades near-term cash interest for medium-term equity dilution.

iv) Catalysts and Key Risks

Catalysts

- **Resolution of the pipeline funding pathway.** A capital partnership for S4/S7, asset-level JV, sell-down of stabilised assets or structured funding vehicle would de-risk the build programme and lift the dilution overhang. A straight equity raise ahead of earnings delivery would do the opposite. Clarity here is, in our view, the precondition for a re-rate.
- **Hyperscaler + Neocloud contract wins and incremental lease signings.** Large, long-dated multi-megawatt commitments determine whether reported earnings converge toward the trajectory implied by the announced pipeline.
- **Utilisation ramp on commissioned capacity.** Newly delivered halls converting from contracted to billing utilisation on or ahead of schedule would validate embedded return assumptions and shorten the lag between capex outflow and earnings contribution.
- **Securing power and land, and progress offshore.** Grid connection capacity is now the scarce input sector-wide.
- **Disclosure of incremental returns on invested capital.** Evidence that new capacity is being delivered at yields comfortably above cost of capital.

Key Risks

- **Funding, dilution and rising interest rates.** The build programme is capital-intensive and front-loaded, with cash outflow preceding revenue by several years and free cash flow negative through the cycle. NXT is structurally reliant on external capital: equity issuance risks dilution ahead of earnings; incremental debt lifts gearing and interest expense into a period of limited cash generation.
- **Execution and development risk.** Delivery is exposed to construction cost inflation, contractor and long-lead equipment availability, grid connection timing and planning delays. Overruns compress development returns directly; delayed commissioning defers revenue against a fixed capital base.
- **Customer concentration.** A meaningful share of contracted capacity sits with a small number of hyperscale customers. Loss, non-renewal, renegotiation on weaker terms or a shift toward self-build would disproportionately impact revenue, utilisation and asset valuations.
- **Competitive supply and pricing + Neocloud competition.** Domestic and offshore operators, private infrastructure capital and hyperscaler self-build are all adding capacity. Metro-level oversupply could compress pricing per megawatt, extend lease-up and erode development margins on speculative capacity.
- **Power cost and sustainability obligations.** Rising energy costs, adverse regulatory change or customer and investor requirements on renewable sourcing and efficiency could raise operating costs, restrict siting or require additional capital.
- **Technology and demand mix.** DCs in space, shifts in workload architecture, AI density and cooling requirements, or slower enterprise migration could leave parts of the footprint less competitive or require retrofit capital.

DigiCo REIT (DGT.AX): Focused on SYD1 execution and pivot to AU strategy; Initiate at Neutral

i) Investment Thesis and Valuation

DigiCo REIT (DGT.AX) is a newly created globally diversified data centre owner, operator and developer. Our balanced thesis is underpinned by the following:

- **SYD1 the anchor asset, but reliant on the ramp.** SYD1 is a best-in-class low-latency metro DC with industry leading yields - the key from here is anchoring the remaining 52MW at strong yields. We expect the capacity to convert to billing over 4Q FY27 and FY28, taking Australian billing capacity from 41MW to a targeted 108MW.
- **Capital re-weighted from the US to AU, where DGT has a proven delivery record.** The capital recycling program, through the sale of CHI1 and the LAX sites, releases cA$470mn of net equity proceeds to fund Australian development across SYD1, the ADL1 15MW expansion and a 1GW+ greenfield pipeline. We see the domestic book as better positioned for growth, with a largely inflation-linked income base and a development pipeline that leverages DGT's existing operating footprint rather than building presence from scratch. If executed, we see scope for DGT to re-rate as it redeploys capital into higher returning domestic projects and works toward its A$250mn stabilised EBITDA target.
- **Balance sheet capacity to fund growth without dilution, but distribution not fully FFO-funded.** With pro-forma net debt of A$0.5bn (18% gearing) and A$1.2bn of liquidity, we consider the balance sheet to be in a robust position - this materially reduces equity raise risk. We would caveat however, that near-term cover looks thin, with our FY27E distribution of 15cps not fully funded by FFO, and growth thereafter reliant on SYD1 ramp.

Valuation: We derive our 12m TP of A$2.6 for DigiCo REIT using an FY29 EV/EBITDA based approach discounted by 9.9%, consistent across our coverage and with our offshore counterparts. We use a 15x multiple, in-line with data centre peer trading multiples. We cross-check our valuation with our DCF, that implies a A$2.30 valuation.

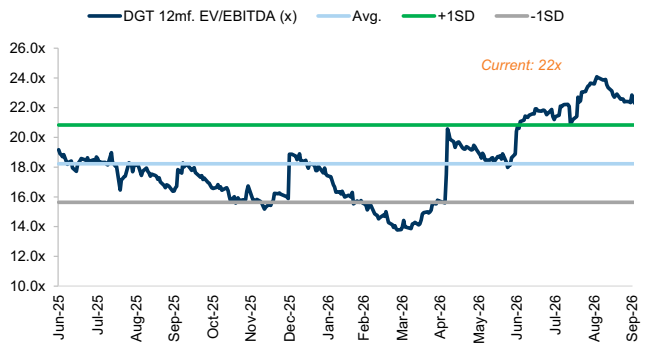

Exhibit 64: We value DGT on a A$2.60 12m TP

ii) Financial Forecasts vs. consensus

Where we are different to consensus?

Revenue: We forecast FY28-29E group revenue -1% to 0% vs consensus. We expect a marginally slower than expected conversion of SYD1 from contracted to billing vs the street, however better than expected execution on this front would pose upside risk to our forecasts. We forecast for broadly stable performance for the iSeek portfolio, however iSeek remains a small percentage of the total portfolio. For the US business, we have CHI1 dropping out of our forecasts since the sale has completed.

EBITDA: We forecast FY28-29E EBITDA -1% vs consensus. Our below the street EBITDA assumptions are underpinned by higher than expected facility and corporate costs vs street as more capacity comes online across SYD1.

NPAT: We forecast FY28-29E NPAT -A$17mn to -A$11mn vs consensus. Our below consensus NPAT is largely driven by lower FY28E tax benefit vs street, lower D&A and higher net interest expense.

Capex: We forecast FY28-29E capex +16% to -4% vs consensus. We expect more of SYD1 capex to be phased across FY28E relative to the street. We forecast for A$1,143mn cumulative capex over FY27-28E vs consensus at A$1,057mn and company estimates of A$1,200mn.

Exhibit 66: Our DGT EBITDA estimates sit below the street

iv) Catalysts and Key Risks

Catalysts

- **LAX asset sales.** The divestment of the LAX1/2 sites is in the final stages of due diligence, with the conditional agreement expected to complete in 1H FY27. The assets are currently held at cUS$70mn.
- **SYD1.** Focus on 52MW expansion where near-term milestones are energising the initial 10MW by the end of FY27 and converting existing LOIs into binding, long-term leases.
- **ADL1 expansion.** Demand-led 15MW expansion, with construction to follow the advanced customer discussions underway. DGT expect ADL1 to be online and billing by end of FY28.
- **New leadership.** FY27 will be the first full year under Co-Heads Simon Mitchell (CFO) and Ralph Goninan (CDO) who stepped up in August.

Key Risks

- **Faster/slower conversion of the SYD1 52MW LOIs.** The LOIs remain subject to binding documentation, so the contracted position is not yet locked. Earlier conversion, or acceleration of tranches beyond the 10MW targeted for late Q4 FY27, would pull FY28 earnings forward. Slippage would leave capital deployed ahead of income.
- **Residual US asset sales and funding headroom.** With CHI1 now settled and delivering the bulk of the cA$470mn of net proceeds, the funding position is substantially de-risked, taking gearing from 39% to 18%. The remaining exposure is LAX1/2, where pricing or timing below expectations would erode headroom at the margin rather than the core funding plan.
- **Execution and development risk.** Delivery of the 52MW SYD1 expansion is exposed to cost inflation, contractor availability and commissioning timing, though SSDA approval, secured grid capacity and a fixed-price D&C contract materially reduce the downside. Slippage would defer revenue and push out the pathway to the A$250mn stabilised EBITDA target - conversely, delivery ahead of our assumptions would pull it forward.
- **Customer concentration and counterparty quality.** DGT's #1 customer represents c28% of group gross income, and hyperscalers make up 52% of the sector mix, so a single non-renewal or renegotiation would negatively impact earnings. Offsetting this, 91% of income sits on fixed escalators with the broader book spanning more than 550 customers while the KCM1/DAL1 extension to 2034 demonstrates renewal capability.
- **Leadership transition.** Simon Mitchell and Ralph Goninan were appointed Co-Heads in Aug-26 while retaining CFO and CDO responsibilities, so FY27 is the first full year under the new management structure.

Macquarie Technology (MAQ.AX): Re-rate likely but will take time: Initiate at Neutral

i) Investment Thesis and Valuation

Macquarie Technology Group (MAQ.AX) is an Australian digital infrastructure provider, operating sovereign data centres, secure cloud and government services, and business telecom for enterprise and public sector customers. Our Neutral view on MAQ is based on the following three drivers:

1. **DC expansion core value driver, but development customer led.** We believe MAQ's re-rating case is centred on converting its 47MW IC3SW site into contracted and billing capacity. With the build staged and demand-led, we expect each incremental tranche across the facility to de-risk the significant capex program and progressively unlock value. However, our view remains balanced as we await announcement of a major hyperscaler anchor tenant to provide better earnings visibility.
2. **Cloud and Government data sovereignty moat, though enterprise AI adoption will take time.** HCF certified status and sovereign cyber capability are difficult to replicate, while growth is multi-year, policy-supported and insulated from the private capex cycle. Our balanced view is underpinned on the pace - not direction - of sovereign AI and GPUaaS spend, where we do expect real revenue opportunities, but anticipate adoption will take time.
3. **Telecom to remain structurally challenged, but funds the build.** The company has sticky, service-led corporate and government contracts with low churn but these are partly offset by declines in legacy fixed and voice data. We expect low-to-mid single digit revenue declines with eroding margins into FY27E, but expect more cost discipline over FY28-29E to drive margin expansion.

Valuation: We derive our 12m TP of A$58 for MAQ using 7x FY27 EV/EBITDA for telecom, 14x FY27 EV/EBITDA for Cloud Services and Government (CS&G), and 15x FY29 EV/EBITDA for DCs discounted by 8.9%, in-line with our data centre coverage.

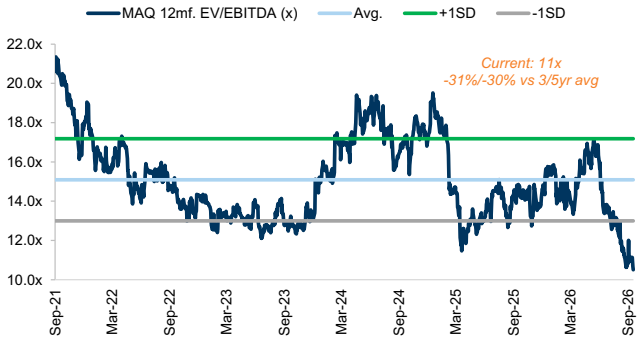

Exhibit 68: Our MAQ 12m TP is A$58

ii) Financial Forecasts vs. consensus

Where we are different to consensus?

Revenue: We forecast FY28-29E group revenue -1% below consensus. We expect telecom revenues to be challenged, and forecast -3% YoY declines over 28-29E driven by continued legacy fixed and voice declines in-line with the industry. For CS&G, we expect mid-single digit revenue growth (+5% to +6% YoY over 28-29E), but expect that enterprise AI adoption takes time and therefore see upside risk vs our forecasts (-3% vs consensus). For data centres, our forecasts sit -3% to -1% vs consensus given our more cautious billing conversion assumptions.

EBITDA: We forecast FY28-29E EBITDA +1% to -1% vs consensus. We sit broadly in-line with consensus on earnings as we expect stronger than expected cost control particularly across telecom where EBITDA sits +2% to +4% vs street, and data centres +8% to +3% vs street (where we expect some margin expansion as capacity ramps).

NPAT: We forecast FY28-29E NPAT +6% to -15% vs consensus. Our NPAT forecasts are underpinned by higher than street D&A driven by IC3SW capacity coming online, partly offset by lower interest and lower tax in outer years.

Capex: We forecast FY28-29E capex +2% vs consensus. We sit slightly above the street for capex assumptions, underpinned by higher capex/MW spend for the remaining build out of IC3SW.

iv) Catalysts and Key Risks

Catalysts

- **IC3SW development.** The most significant near-term catalyst for the business. Phase 2 adds 13MW with completion expected June 2027, which takes total capacity available to 19MW (vs 47MW potential capacity). We see securing a hyperscaler anchor tenant for IC3SW as the key event that could drive a re-rating.
- **Macquarie Enterprise Technology Centre (METC) opportunity.** MAQ has acquired land in Macquarie Park to support a proposed 200MW facility, with initial construction estimated for completion in late CY29. Securing key planning approvals would likewise support a re-rating.
- **Sovereign investment.** MAQ has received significant endorsement from the Govt via a A$200mn investment from the National Reconstruction Fund Corporation (NRFC). We view further potential public sector funding as a key opportunity.

Key Risks

- **Faster/slower than expected IC3SW capacity ramp.** Securing a hyperscaler anchor earlier than anticipated would bring revenue forward, while a slower lease-up would see the asset begin depreciating ahead of meaningful earnings. Given the size of the capital outlay a shift in the pace of the ramp either way would impact earnings and funding capacity.
- **Funding, dilution and interest rate sensitivity.** The build is front-loaded and capital-intensive, with cash outflows preceding revenue. Funding may involve equity dilution or additional debt and a higher-for-longer rate environment would lift both funding costs and the cap rate on assets. However, an asset-level capital partner, stake sale or further public sector funding would fund the build without capital dilution.
- **Execution and development risk.** Delivery at IC3SW and METC is subject to cost inflation, contractor and long-lead equipment availability. Exceeding internal cost targets would reduce development returns and delayed commissioning would defer revenue. Conversely, on-time delivery would bring revenue forward and realise value we see as only partly reflected in the share price.
- **Faster/slower take-up of enterprise AI demand.** Our base case assumes limited contribution from enterprise AI demand. Faster adoption would support sovereign AI and GPUaaS revenue and tighten data centre demand further. Slower adoption, constrained by data governance and procurement cycles, would leave AI-linked capacity underutilised.
- **Cybersecurity and sovereign trust.** CS&G depends on being trusted with sensitive workloads, and that trust is built slowly but could be impacted by a single incident. A material breach or loss of hosting certification would have consequences beyond the contract involved, weighing on the sovereign positioning that underpins segment economics. The upside is continuity, with scope for incremental share as agencies consolidate onto certified providers.

Appendix

1. M&A Framework

Across our global coverage, we examine stocks using an M&A framework, considering both qualitative factors and quantitative factors (which may vary across sectors and regions) to incorporate the potential that certain companies could be acquired. We then assign an M&A rank as a means of scoring companies under our rated coverage from 1 to 3, with 1 representing high (30%-50%) probability of the company becoming an acquisition target, 2 representing medium (15%-30%) probability and 3 representing low (0%-15%) probability. For companies ranked 1 or 2, in line with our standard departmental guidelines we incorporate an M&A component into our target price. M&A rank of 3 is considered immaterial and therefore does not factor into our price target, and may or may not be discussed in research. We allocated an M&A rank of 3 for all the stocks in our ANZ data centre coverage.

Investment Thesis - Goodman Group

Goodman Group (GMG.AX) owns, develops, and manages high-quality industrial property and digital infrastructure in major global cities. Our positive outlook is driven by three key factors: (1) Strategic Land Bank & Aligned Management: GMG portfolio focuses on high-barrier-to-entry urban locations. Management has a proven track record of disciplined capital allocation, with executive incentives closely aligned with shareholders through co-investments and long-dated equity; (2) Core Industrial Growth: Structurally tight vacancies in infill markets, positive rental reversions, and a constrained development pipeline support steady income growth. Additionally, an easing interest rate environment provides a tailwind by compressing cap rates and reactivating third-party capital; (3) Data Center Accelerator: Backed by a secured global power bank, Goodman's expanding digital infrastructure pipeline serves as the primary catalyst for development earnings and external AUM growth over the medium term.

Price Target Risks and Methodology - Goodman Group

We are Buy rated on GMG and derive our 12m TP of A$32 using an FY27 EV/EBITDA based approach, consistent across our coverage. We use a 21X multiple, in-line with global DC/industrial peers. Key risks: (1) Cyclicality of real estate values; (2) Development risk; (3) Ability to attract third party capital; (4) GMG's ability to restock its development pipeline; (5) Retention of key personnel.

Investment Thesis - Megaport

Megaport (MP1.AX) is a global automated infrastructure platform, providing enterprises with private network, compute and storage on demand. Our positive view on Megaport is based on the following three drivers: (1) Significant global network footprint and entrenched ecosystem position. MP1's fabric is its competitive moat, globally embedded across carrier-neutral data centres with direct on-ramps into all major hyperscalers - which cannot be replicated at scale without significant time and investment; (2) Stable, high-margin core subscription business that self-funds its growth. Interconnection business that generates recurring, contracted revenue at high gross margin, spread across a diversified enterprise base with low concentration. Incremental revenue lands on a largely fixed network cost base, driving significant operating leverage with limited additional capex - and generating cash flow that funds the expansion set out below; (3) Accelerating full-stack AI infrastructure expansion, with strong economics and returns. MP1's ability to sell network, compute and storage as a single integrated stack uniquely positions the business to win AI training and inference workloads. Although the build is capital intensive, contract economics are compelling - take or pay contracts with c2yr payback period. We also see upside scope for MP1 to sweat the useful life of its GPU/CPU fleet beyond the initial contract term, supporting strong returns on capital deployed.

Price Target Risks and Methodology - Megaport

We are Buy rated on Megaport and derive our 12m TP of A$25.90 using an FY27 EV/EBITDA based approach, consistent across our coverage. We use an 18X multiple, in-line with global peers. Key risks: (1) AI sentiment; (2) Supply chain constraints; (3) Contract renewal risk; (4) Disintermediation risk; (5) Securing land, space and power ahead of the GPUs

Investment Thesis - NEXTDC

NEXTDC is an Australian owner, developer and operator of high-performance colocation data centres, serving hyperscale cloud providers, enterprises and government across a national footprint of interconnected facilities. Our neutral view on NEXTDC is predicated on three considerations: (1) Structural demand is intact, but is now the consensus view. Enterprise cloud migration continues to compound, and the ongoing evolution of AI is increasing high-density capacity. Contracted revenue and a sticky customer base underpin a proven and profitable operating model; (2) Funding is the handbrake on growth, not demand. The binding constraint on NXT is no longer whether the capacity can be leased - it is the cost, availability and dilution associated with financing the build. At A$20m/MW build costs, we estimate a funding shortfall of A$1bn for WIP and >A$40bn for full landbank; (3) Execution, timing and concentration temper earnings visibility. Contract timing remains the principal swing factor on near-term forecasts, and a small number of large customers account for a meaningful share of contracted

capacity. Competitive supply additions, power and land constraints, and the risk of cost or schedule overruns on new sites further widen the distribution of outcomes around our base case.

Price Target Risks and Methodology - NEXTDC Ltd

We are Neutral rated on NXT and derive our 12m TP of A$11 for NEXTDC using a 22x FY29 EV/EBITDA (discounted at 9.0%) based approach. Key risks: (1) Funding, dilution and rising interest rates; (2) Execution and development risk; (3) Customer concentration; (4) Competitive supply and pricing + Neocloud competition; (5) Power cost and sustainability obligations; (6) Technology and demand mix.

Investment Thesis - DigiCo REIT

DigiCo REIT (DGT.AX) is a newly created globally diversified data centre owner, operator and developer. Our balanced thesis is underpinned by the following: (1) SYD1 the anchor asset, but reliant on the ramp. SYD1 is a best-in-class low-latency metro DC with industry leading yields - the key from here is anchoring the remaining 52MW at strong yields. We expect the capacity to convert to billing over 4Q FY27 and FY28, taking Australian billing capacity from 41MW to a targeted 108MW; (2) Capital re-weighted from the US to AU, where DGT has a proven delivery record. The capital recycling program, through the sale of CHI1 and the LAX sites, releases cA$470mn of net equity proceeds to fund Australian development across SYD1, the ADL1 15MW expansion and a 1GW+ greenfield pipeline. We see the domestic book as better positioned for growth, with a largely inflation-linked income base and a development pipeline that leverages DGT's existing operating footprint rather than building presence from scratch. If executed, we see scope for DGT to re-rate as it redeploys capital into higher returning domestic projects and works toward its A$250mn stabilised EBITDA target; (3) Balance sheet capacity to fund growth without dilution, but distribution not fully FFO-funded. We consider the balance sheet to be in a robust position - this materially reduces equity raise risk. We would caveat however, that near-term cover looks thin, with our FY27E distribution not fully funded by FFO, and growth thereafter reliant on SYD1 ramp.

Price Target Risks and Methodology - DigiCo REIT

We are Neutral rated on DigiCo and derive our 12m TP of A$2.6 for DigiCo REIT using an FY29 EV/EBITDA based approach discounted by 9.9%, consistent across our coverage. We use a 15x multiple, in-line with peers. We cross-check our valuation with our DCF, that derives a A$2.30 valuation.

Investment Thesis - Macquarie Technology Group

Macquarie Technology Group (MAQ.AX) is an Australian digital infrastructure provider, operating sovereign data centres, secure cloud and government services, and business telecom for enterprise and public sector customers. Our Neutral on MAQ is based on the following three drivers: (1) DC expansion core value driver, but development customer led. We believe MAQ's re-rating case is centred on converting 47MW IC3SW site into contracted and billing capacity. With the build staged and demand-led, we expect each incremental tranche across the facility to de-risk the significant capex program and progressively unlock value. However, our view remains balanced as we await announcement of a major hyperscaler anchor tenant to provide better earnings visibility; (2) Cloud and Government data sovereignty moat, though enterprise AI

adoption will take time. HCF certified status and sovereign cyber capability are difficult to replicate, while growth is multi-year, policy-supported and insulated from the private capex cycle. Our balanced view is underpinned on the pace - not direction - of sovereign AI and GPUaaS spend, where we do expect real revenue opportunities, but anticipate adoption will take time; (3) Telecom to remain structurally challenged, but funds the build. Sticky, service-led corporate and government contracts with low churn but partly offset by declines in legacy fixed and voice data. We expect low-to-mid single digit revenue declines with eroding margins into FY27E, but expect more cost discipline over FY28-29E to drive margin expansion.

Price Target Risks and Methodology - Macquarie Technology Group

We are Neutral rated on MAQ and derive our 12m TP of A$58 for MAQ using 7x FY27 EV/EBITDA for telecom, 14x FY27 EV/EBITDA for CS&G, and 15x FY29 EV/EBITDA for DCs discounted by 8.9%. Key risks: (1) Faster/slower than expected IC3SW capacity ramp; (2) Funding, dilution and interest rate sensitivity; (3) Execution and development risk; (4) Faster/slower take-up of enterprise AI demand; (5) Cybersecurity and sovereign trust.

Investment Thesis - Infratil

Infratil is a global investment manager operating across secular thematics, including digital infrastructure, renewable energy, healthcare infrastructure, and airports. We are positive on the business, with our view underpinned by the following factors: (1) Long-standing track record to allocated capital across its three pillar investment framework. We believe its competitive moat stems from its open-ended, self-funded capital structure where it holds strong performers over the long term, recycles capital from stable cash generating assets into growth platforms, and actively manages the portfolio through strategic divestments of non-core assets; (2) One NZ, a reliable cash generator that funds growth platforms through its ability to deliver sustainable, consistent through-the-cycle earnings growth.

Price Target Risks and Methodology - Infratil

We have a Buy rating on IFT.NZ and a 12m TP of NZ$17.60/share. We value the business on a SOTP basis, using a mix of listed peer multiples (One NZ), fair value, and NPV (for incentive fees and corporate costs). We apply a -10% conglomerate discount to our valuation. Key risks: (1) Portfolio concentration; (2) Longroad capex/build risk; (3) One NZ macro and cost out uncertainty; (4) FX.

GS Factor Profile

The Goldman Sachs Factor Profile provides investment context for a stock by comparing key attributes to the market (i.e. our universe of rated stocks) and its sector peers. The four key attributes depicted are: Growth, Financial Returns, Multiple (e.g. valuation) and Integrated (a composite of Growth, Financial Returns and Multiple). Growth, Financial Returns and Multiple are calculated by using normalized ranks for specific metrics for each stock. The normalized ranks for the metrics are then averaged and converted into percentiles for the relevant attribute. The precise calculation of each metric may vary depending on the fiscal year, industry and region, but the standard approach is as follows:

Growth is based on a stock's forward-looking sales growth, EBITDA growth and EPS growth (for financial stocks, only EPS and sales growth), with a higher percentile indicating a higher growth company. **Financial Returns** is based on a stock's forward-looking ROE, ROCE and CROCI (for financial stocks, only ROE), with a higher percentile indicating a company with higher financial returns. **Multiple** is based on a stock's forward-looking P/E, P/B, price/dividend (P/D), EV/EBITDA, EV/FCF and EV/Debt Adjusted Cash Flow (DACF) (for financial stocks, only P/E, P/B and P/D), with a higher percentile indicating a stock trading at a higher multiple. The **Integrated** percentile is calculated as the average of the Growth percentile, Financial Returns percentile and (100% - Multiple percentile).

Financial Returns and Multiple use the Goldman Sachs analyst forecasts at the fiscal year-end at least three quarters in the future. Growth uses inputs for the fiscal year at least seven quarters in the future compared with the year at least three quarters in the future (on a per-share basis for all metrics).

For a more detailed description of how we calculate the GS Factor Profile, please contact your GS representative.

M&A Rank

Across our global coverage, we examine stocks using an M&A framework, considering both qualitative factors and quantitative factors (which may vary across sectors and regions) to incorporate the potential that certain companies could be acquired. We then assign a M&A rank as a means of scoring companies under our rated coverage from 1 to 3, with 1 representing high (30%-50%) probability of the company becoming an acquisition target, 2 representing medium (15%-30%) probability and 3 representing low (0%-15%) probability. For companies ranked 1 or 2, in line with our standard departmental guidelines we incorporate an M&A component into our target price. M&A rank of 3 is considered immaterial and therefore does not factor into our price target, and may or may not be discussed in research.

Quantum

Quantum is Goldman Sachs' proprietary database providing access to detailed financial statement histories, forecasts and ratios. It can be used for in-depth analysis of a single company, or to make comparisons between companies in different sectors and markets.

Disclosures

The rating(s) for DigiCo REIT, Goodman Group, Infratil, Macquarie Technology Group, Megaport Ltd. and NEXTDC Ltd is/are relative to the other companies in its/their coverage universe: DigiCo REIT, Goodman Group, Infratil, Macquarie Technology Group, Megaport Ltd., NEXTDC Ltd

Company-specific regulatory disclosures

Regulatory disclosures

Disclosures required by United States laws and regulations

See company-specific regulatory disclosures above for any of the following disclosures required as to companies referred to in this report: manager or co-manager in a pending transaction; 1% or other ownership; compensation for certain services; types of client relationships; managed/co-managed public offerings in prior periods; directorships; registered market maker. Goldman Sachs trades or may trade as a principal in debt securities (or in related derivatives) of issuers discussed in this report.

The following are additional required disclosures: **Ownership and material conflicts of interest:** Goldman Sachs policy prohibits its analysts, professionals reporting to analysts and members of their households from owning securities of any company in the analyst's area of coverage. **Analyst compensation:** Analysts are paid in part based on the profitability of Goldman Sachs, which includes investment banking revenues. **Analyst as officer or director:** Goldman Sachs policy generally prohibits its analysts, persons reporting to analysts or members of their households from serving as an officer, director or advisor of any company in the analyst's area of coverage. **Non-U.S. Analysts:** Non-U.S. analysts may not be associated persons of Goldman Sachs & Co. LLC and therefore may not be subject to FINRA Rule 2241 or FINRA Rule 2242 restrictions on communications with a subject company, public appearances and trading in securities covered by the analysts.

Additional disclosures required under the laws and regulations of jurisdictions other than the United States

The following disclosures are those required by the jurisdiction indicated, except to the extent already made above pursuant to United States laws and regulations. **Australia:** Goldman Sachs Australia Pty Ltd and its affiliates are not authorised deposit-taking institutions (as that term is defined in the

Banking Act 1959 (Cth)) in Australia and do not provide banking services, nor carry on a banking business, in Australia. This research, and any access to it, is intended only for "wholesale clients" within the meaning of the Australian Corporations Act, unless otherwise agreed by Goldman Sachs. In producing research reports, members of Global Investment Research of Goldman Sachs Australia may attend site visits and other meetings hosted by the companies and other entities which are the subject of its research reports. In some instances the costs of such site visits or meetings may be met in part or in whole by the issuers concerned if Goldman Sachs Australia considers it is appropriate and reasonable in the specific circumstances relating to the site visit or meeting. To the extent that the contents of this document contains any financial product advice, it is general advice only and has been prepared by Goldman Sachs without taking into account a client's objectives, financial situation or needs. A client should, before acting on any such advice, consider the appropriateness of the advice having regard to the client's own objectives, financial situation and needs. A copy of certain Goldman Sachs Australia and New Zealand disclosure of interests and a copy of Goldman Sachs' Australian Sell-Side Research Independence Policy Statement are available at: https://www.goldmansachs.com/disclosures/australia-new-zealand/index.html. **Brazil:** Disclosure information in relation to CVM Resolution n. 20 is available at https://www.gs.com/worldwide/brazil/area/gir/index.html. Where applicable, the Brazil-registered analyst primarily responsible for the content of this research report, as defined in Article 20 of CVM Resolution n. 20, is the first author named at the beginning of this report, unless indicated otherwise at the end of the text. **Canada:** This information is being provided to you for information purposes only and is not, and under no circumstances should be construed as, an advertisement, offering or solicitation by Goldman Sachs & Co. LLC for purchasers of securities in Canada to trade in any Canadian security. Goldman Sachs & Co. LLC is not registered as a dealer in any jurisdiction in Canada under applicable Canadian securities laws and generally is not permitted to trade in Canadian securities and may be prohibited from selling certain securities and products in certain jurisdictions in Canada. If you wish to trade in any Canadian securities or other products in Canada please contact Goldman Sachs Canada Inc., an affiliate of The Goldman Sachs Group Inc., or another registered Canadian dealer. **Hong Kong:** Further information on the securities of covered companies referred to in this research may be obtained on request from Goldman Sachs (Asia) L.L.C. **India:** Further information on the subject company or companies referred to in this research may be obtained from Goldman Sachs (India) Securities Private Limited, Research Analyst - SEBI Registration Number INH000001493, 10th Floor, Ascent-Worli, Sudam Kalu Ahire Marg, Worli, Mumbai-400 025, India, Corporate Identity Number U74140MH2006FTC160634, Phone +91 22 6616 9000, Fax +91 22 6616 9001. Goldman Sachs may beneficially own 1% or more of the securities (as such term is defined in clause 2 (h) the Indian Securities Contracts (Regulation) Act, 1956) of the subject company or companies referred to in this research report. Registration granted by SEBI and certification from NISM in no way guarantee performance of the intermediary or provide any assurance of returns to investors. Goldman Sachs (India) Securities Private Limited compliance officer and investor grievance contact details, a copy of the annual compliance audit report and other relevant information and disclosures can be found at this link: https://www.goldmansachs.com/worldwide/india/research-analyst. **Japan:** See below. **Korea:** This research, and any access to it, is intended only for "professional investors" within the meaning of the Financial Services and Capital Markets Act, unless otherwise agreed by Goldman Sachs. Further information on the subject company or companies referred to in this research may be obtained from Goldman Sachs (Asia) L.L.C., Seoul Branch. **New Zealand:** Goldman Sachs New Zealand Limited and its affiliates are neither "registered banks" nor "deposit takers" (as defined in the Reserve Bank of New Zealand Act 1989) in New Zealand. This research, and any access to it, is intended for "wholesale clients" (as defined in the Financial Advisers Act 2008) unless otherwise agreed by Goldman Sachs. A copy of certain Goldman Sachs Australia and New Zealand disclosure of interests is available at: https://www.goldmansachs.com/disclosures/australia-new-zealand/index.html. **Russia:** Research reports distributed in the Russian Federation are not advertising as defined in the Russian legislation, but are information and analysis not having product promotion as their main purpose and do not provide appraisal within the meaning of the Russian legislation on appraisal activity. Research reports do not constitute a personalized investment recommendation as defined in Russian laws and regulations, are not addressed to a specific client, and are prepared without analyzing the financial circumstances, investment profiles or risk profiles of clients. Goldman Sachs assumes no responsibility for any investment decisions that may be taken by a client or any other person based on this research report. **Singapore:** Goldman Sachs (Singapore) Pte. (Company Number: 198602165W), which is regulated by the Monetary Authority of Singapore, accepts legal responsibility for this research, and should be contacted with respect to any matters arising from, or in connection with, this research. **Taiwan:** This material is for reference only and must not be reprinted without permission. Investors should carefully consider their own investment risk. Investment results are the responsibility of the individual investor. **United Kingdom:** Persons who would be categorized as retail clients in the United Kingdom, as such term is defined in the rules of the Financial Conduct Authority, should read this research in conjunction with prior Goldman Sachs research on the covered companies referred to herein and should refer to the risk warnings that have been sent to them by Goldman Sachs International. A copy of these risks warnings, and a glossary of certain financial terms used in this report, are available from Goldman Sachs International on request.

European Union and United Kingdom: Disclosure information in relation to Article 6 (2) of the European Commission Delegated Regulation (EU) (2016/958) supplementing Regulation (EU) No 596/2014 of the European Parliament and of the Council (including as that Delegated Regulation is implemented into United Kingdom domestic law and regulation following the United Kingdom's departure from the European Union and the European Economic Area) with regard to regulatory technical standards for the technical arrangements for objective presentation of investment recommendations or other information recommending or suggesting an investment strategy and for disclosure of particular interests or indications of conflicts of interest is available at https://www.gs.com/disclosures/europeanpolicy.html which states the European Policy for Managing Conflicts of Interest in Connection with Investment Research.

Japan: Goldman Sachs Japan Co., Ltd. is a Financial Instrument Dealer registered with the Kanto Financial Bureau under registration number Kinsho 69, and a member of Japan Securities Dealers Association, Financial Futures Association of Japan Type II Financial Instruments Firms Association, and Investment Management Association of Japan. Sales and purchase of equities are subject to commission pre-determined with clients plus consumption tax. See company-specific disclosures as to any applicable disclosures required by Japanese stock exchanges, the Japanese Securities Dealers Association or the Japanese Securities Finance Company.

Ratings, coverage universe and related definitions

Buy (B), Neutral (N), Sell (S) Analysts recommend stocks as Buys or Sells for inclusion on various regional Investment Lists. Being assigned a Buy or Sell on an Investment List is determined by a stock's total return potential relative to its coverage universe. Any stock not assigned as a Buy or a Sell on an Investment List with an active rating (i.e., a stock that is not Rating Suspended, Not Rated, Early-Stage Biotech, Coverage Suspended or Not Covered), is deemed Neutral. Each region manages Regional Conviction Lists, which are selected from Buy rated stocks on the respective region's Investment Lists and represent investment recommendations focused on the size of the total return potential and/or the likelihood of the realization of the return across their respective areas of coverage. The addition or removal of stocks from such Conviction Lists are managed by the Investment Review Committee or other designated committee in each respective region and do not represent a change in the analysts' investment rating for such stocks.

Total return potential represents the upside or downside differential between the current share price and the price target, including all paid or anticipated dividends, expected during the time horizon associated with the price target. Price targets are required for all covered stocks. The total return potential, price target and associated time horizon are stated in each report adding or reiterating an Investment List membership.

Coverage Universe: A list of all stocks in each coverage universe is available by primary analyst, stock and coverage universe at https://www.gs.com/research/hedge.html.

Not Rated (NR). The investment rating, target price and earnings estimates (where relevant) are removed pursuant to Goldman Sachs policy when Goldman Sachs is acting in an advisory capacity in a merger or in a strategic transaction involving this company, when there are legal, regulatory or policy constraints due to Goldman Sachs' involvement in a transaction, and in certain other circumstances. **Early-Stage Biotech (ES).** An investment rating and a target price are not assigned pursuant to Goldman Sachs policy when this company has neither a drug, treatment or medical device that has passed a Phase II clinical trial nor a license to distribute a post-Phase II drug, treatment or medical device. **Rating Suspended (RS).** Goldman Sachs

Research has suspended the investment rating and price target for this stock, because there is not a sufficient fundamental basis for determining an investment rating or target price. The previous investment rating and target price, if any, are no longer in effect for this stock and should not be relied upon. **Coverage Suspended (CS).** Goldman Sachs has suspended coverage of this company. **Not Covered (NC).** Goldman Sachs does not cover this company.

Global product; distributing entities

Goldman Sachs Global Investment Research produces and distributes research products for clients of Goldman Sachs on a global basis. Analysts based in Goldman Sachs offices around the world produce research on industries and companies, and research on macroeconomics, currencies, commodities and portfolio strategy. This research is disseminated in Australia by Goldman Sachs Australia Pty Ltd (ABN 21 006 797 897); in Brazil by Goldman Sachs do Brasil Corretora de Títulos e Valores Mobiliários S.A.; Public Communication Channel Goldman Sachs Brazil: 0800 727 5764 and / or contatogoldmanbrasil@gs.com. Horário de funcionamento: segunda-feira à sexta-feira (exceto feriados), das 9h às 18h; in Canada by Goldman Sachs & Co. LLC; in Hong Kong by Goldman Sachs (Asia) L.L.C.; in India by Goldman Sachs (India) Securities Private Ltd.; in Japan by Goldman Sachs Japan Co., Ltd.; in the Republic of Korea by Goldman Sachs (Asia) L.L.C., Seoul Branch; in New Zealand by Goldman Sachs New Zealand Limited; in Russia by OOO Goldman Sachs; in Singapore by Goldman Sachs (Singapore) Pte. (Company Number: 198602165W); and in the United States of America by Goldman Sachs & Co. LLC. Goldman Sachs International has approved this research in connection with its distribution in the United Kingdom.

Goldman Sachs International ("GSI"), authorised by the Prudential Regulation Authority ("PRA") and regulated by the Financial Conduct Authority ("FCA") and the PRA, has approved this research in connection with its distribution in the United Kingdom.

European Economic Area: Goldman Sachs Bank Europe SE ("GSBE") is a credit institution incorporated in Germany and, within the Single Supervisory Mechanism, subject to direct prudential supervision by the European Central Bank and in other respects supervised by German Federal Financial Supervisory Authority (Bundesanstalt für Finanzdienstleistungsaufsicht, BaFin) and Deutsche Bundesbank and disseminates research within the European Economic Area.

General disclosures

This research is for our clients only. Other than disclosures relating to Goldman Sachs, this research is based on current public information that we consider reliable, but we do not represent it is accurate or complete, and it should not be relied on as such. The information, opinions, estimates and forecasts contained herein are as of the date hereof and are subject to change without prior notification. We seek to update our research as appropriate, but various regulations may prevent us from doing so. Other than certain industry reports published on a periodic basis, the large majority of reports are published at irregular intervals as appropriate in the analyst's judgment.

Goldman Sachs conducts a global full-service, integrated investment banking, investment management, and brokerage business. We have investment banking and other business relationships with a substantial percentage of the companies covered by Global Investment Research. Goldman Sachs & Co. LLC, the United States broker dealer, is a member of SIPC (https://www.sipc.org).

Our salespeople, traders, and other professionals may provide oral or written market commentary or trading strategies to our clients and principal trading desks that reflect opinions that are contrary to the opinions expressed in this research. Our asset management area, principal trading desks and investing businesses may make investment decisions that are inconsistent with the recommendations or views expressed in this research.

The analysts named in this report may have from time to time discussed with our clients, including Goldman Sachs salespersons and traders, or may discuss in this report, trading strategies that reference catalysts or events that may have a near-term impact on the market price of the equity securities discussed in this report, which impact may be directionally counter to the analyst's published price target expectations for such stocks. Any such trading strategies are distinct from and do not affect the analyst's fundamental equity rating for such stocks, which rating reflects a stock's return potential relative to its coverage universe as described herein.

We and our affiliates, officers, directors, and employees will from time to time have long or short positions in, act as principal in, make a market or act as liquidity provider in, and buy or sell, any securities, derivatives, or other financial instruments referred to in this research (including any financial instruments issued by the companies referred to herein), unless otherwise prohibited by regulation or Goldman Sachs policy.

The views attributed to third party presenters at Goldman Sachs arranged conferences, including individuals from other parts of Goldman Sachs, do not necessarily reflect those of Global Investment Research and are not an official view of Goldman Sachs.

Any third party referenced herein, including any salespeople, traders and other professionals or members of their household, may have positions in the products mentioned that are inconsistent with the views expressed by analysts named in this report.

This research is not an offer to sell or the solicitation of an offer to buy any security in any jurisdiction where such an offer or solicitation would be illegal. It does not constitute a personal recommendation or take into account the particular investment objectives, financial situations, or needs of individual clients. Clients should consider whether any advice or recommendation in this research is suitable for their particular circumstances and, if appropriate, seek professional advice, including tax advice. The price and value of investments referred to in this research and the income from them may fluctuate. Past performance is not a guide to future performance, future returns are not guaranteed, and a loss of original capital may occur. Fluctuations in exchange rates could have adverse effects on the value or price of, or income derived from, certain investments.

Certain transactions, including those involving futures, options, and other derivatives, give rise to substantial risk and are not suitable for all investors. Investors should review current options and futures disclosure documents which are available from Goldman Sachs sales representatives or at https://www.theocc.com/about/publications/character-risks.jsp and https://www.goldmansachs.com/disclosures/cftc_fcm_disclosures. Transaction costs may be significant in option strategies calling for multiple purchase and sales of options such as spreads. Supporting documentation will be supplied upon request.

Differing Levels of Service provided by Global Investment Research: The level and types of services provided to you by Goldman Sachs Global Investment Research may vary as compared to that provided to internal and other external clients of GS, depending on various factors including your individual preferences as to the frequency and manner of receiving communication, your risk profile and investment focus and perspective (e.g., marketwide, sector specific, long term, short term), the size and scope of your overall client relationship with GS, and legal and regulatory constraints. As an example, certain clients may request to receive notifications when research on specific securities is published, and certain clients may request that specific data underlying analysts' fundamental analysis available on our internal client websites be delivered to them electronically through data feeds or otherwise. No change to an analyst's fundamental research views (e.g., ratings, price targets, or material changes to earnings estimates for equity securities), will be communicated to any client prior to inclusion of such information in a research report broadly disseminated through electronic publication to our internal client websites or through other means, as necessary, to all clients who are entitled to receive such reports.

All research reports are disseminated and available to all clients simultaneously through electronic publication to our internal client websites. Not all research content is redistributed to our clients or available to third-party aggregators, nor is Goldman Sachs responsible for the redistribution of our research by third party aggregators. For research, models or other data related to one or more securities, markets or asset classes (including related

services) that may be available to you, please contact your GS representative or go to https://research.gs.com.

Disclosure information is also available at https://www.gs.com/research/hedge.html or from Research Compliance, 200 West Street, New York, NY 10282.
