JPM | US Energy: Megawatts, Molecules & Minerals: Thoughts on Power, Earnings for the Week Ahead

Brendan Henrici, CFA
+1 212 622 2729
brendan.henrici@jpmorgan.com

Introduction:

Hello all! Thought I would standardize the weekly as we head into earnings. Going forward, the weekly will break down into 4 sections: By the Numbers, Field Notes, Flows & Positioning & Earnings for the Week Ahead. By the Numbers will be the latest data points that have caught my eye in energy, renewables, metals & mining, utilities and elsewhere. Field Notes will be random thoughts and musings of mine as well as feedback from investors. Flows & Positioning will be 1) the latest COT data and 2) ETF flows sorted by rolling one week inflow. Earnings for the week ahead will be thoughts on select forthcoming earnings.
As always, the below is the view of sales & investor feedback and not that of research unless explicitly stated.

By the Numbers:

- **$86/bbl:** The FY27 WTI strip price. Now the highest level of the year. +50% YTD.
- **$40/bbl or $81mm**: The cost of shipping 2mb of oil from US to Japan in late November. Up from $4.55/bbl or $9.1mm in 2025. (Reuters)
- **91%:** The proportion of times since 1925 the S&P 500 was positive in the 9 months spanning from 4Q of a midterms year to 2Q of the year that follows. The average return over that period for the S&P 500 is 19.8% (Fisher Investments)
- **80%:** The proportion of the global diesel deficit JPM commodities believes can be covered by way of recently announced measures from the EU, China & Russia (here).
- **72%**: Spot TTF vs. its 200 Day moving average. The widest this spread has been in 2026 was 87%. In 2022, it reached 120% .
- **63%**: The jump in EU EV sales in August. EVs as a share of the European market is now 28%. (FT).
- **52%:** The proportion of investors who see there being manufacturing overcapacity in BTM by FY30 according to a survey from our clean energy team.
- **32%:** The drawdown in "behind the meter" stocks since mid-June. As proxied by JP1ZBTME Index. The largest BTM drawdown in the post-Chat-GPT era was 39% after Liberation Day.
- **18%:** The proportion of ICLN (Global Clean Energy) constituents trading above their 200D Moving average—the lowest level in 18 months.
- **10**%: The proportion of global iron ore supply that is now unprofitable due surging energy and freight costs, according to Vale (Bloomberg).
- **1%:** The increase in airline bookings (to 2.3bn) in 1H26 despite a double digit rise in fares YoY. According to OAG (FT).

Field Notes:

Equities, much better than any other asset class, discount macro events, fundamental changes, and regulatory shifts long before there is an article that pinpoints those changes. Long before there is financial twitter discourse. Long before its on the cover of The Economist. Long before its a Bloomberg red headline. Long before any of those articles, headlines or doomer pontificating, stocks price it in. It seems simple but, in the same way it paid to be a seller 4-6mo ago when the zeitgeist was goldilocks, it will pay to be a buyer when the zeitgeist is doom & gloom. As a former colleague of mine used to put it: "*When equity guys are waxing poetic about credit spreads, you're closer to the end than the beginning."*

Power and AI-adjacent energy stocks have been discounting the now-well-covered macro "issues" for months. In some cases, like the IPPs (which peaked last October), they began discounting these issues a year ago. At the time, we just didn't have a headline to tuck neatly next to it. As one example, IPPs peaked in October of 2025. The Ratepayer Protection Pledge, which formalized the thorn in the side of IPPs that is BYOP, didn't come until 4 months later.

IPPs Peaked First...

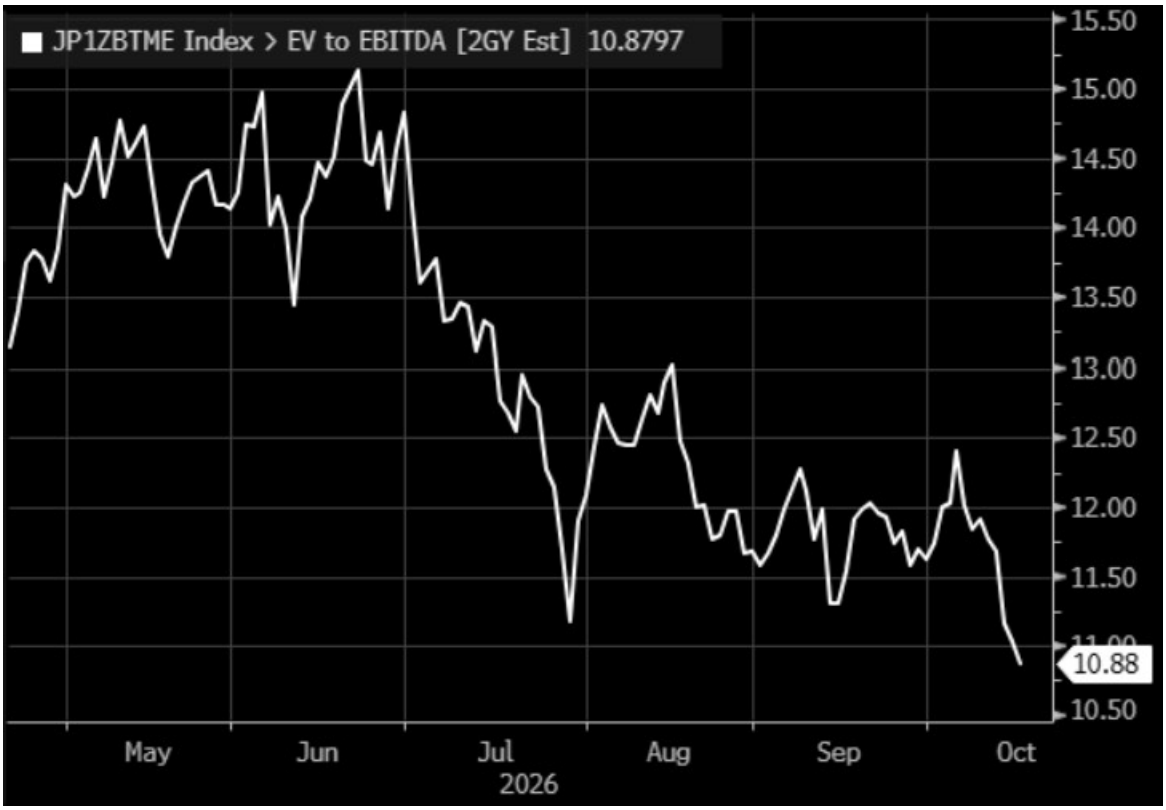

Source: Bloomberg Finance

So often the sequence of events is as follows: 1) stocks move off peak without headline attribution, which draws comments like "why is this happening? The fundamentals (or, revisions) are still *so* good." That line of thinking turns into defiance: "this *has* to turn." Ultimately the sentiment becomes near apoplectic. Finally, usually near that apoplectic sentiment point, the headlines arrive. We "learn" the reasons *why* the stories have "changed." The red headlines hit. The ink is spilled in publication X, Y, or Z which makes it feel "official." At that point—the point it seems we are at now— people throw in the towel. They have a "reason"

why things are bad or "have changed." But the reality is that the stocks, at that point, had already discounted these headwinds. *They had been doing so for months.*

This brings us to today. In my opinion, the time to be negative about credit, rates or growth as it pertains to power/AI infra names isn't now (after everything has de-rated to compensate for the risk), it was 6 months ago as we approached euphoria. In fact, the market internals seem to suggest things are *improving,* not worsening…

BTM FY27E EV/EBITDA: The De-Rating Has Compensated for Risk

Source: Bloomberg Finance

So, with that in mind, what are the stocks telling us *today* about what could happen in the future? Let's start by establishing something: for energy, there was a very specific sequence in the weakness of AI pockets. IPPs peaked first (last October), then regulated utilities (April), then solar /renewables (end of May), then finally BTM (June). **So, if you want to look for a "sign" that the power trade is turning, you probably want to see the sectors that *peaked first, turn first.*** Well, if you've been watching IPPs and Regulated Utilities—the earliest sectors to peak— the past 2 weeks, you have clear evidence of that:**Our IPP basket moved above its 200-day moving average for the first time in 7 months earlier in October, while Utilities, already up 7% this month, are *pacing* for their best month since September 2000.**

While it may be easy to look at the rally in Utilities and chalk it up to factors (look how well low vol is performing, for example) or the sector's bond proxy nature, look at the news we have gotten the past few weeks: NI/MSFT, AEP/GOOGL, CEG/GOOGL, CEG/AMZN, BKH/GOOGL. Things are happening. The rate of change is improving. *The fog is clearing*.

Utilities Are *Pacing* for Their Best Month Since 2000...

Brendan Henrici - Specialist Sales - US Energy AC
brendan.henrici@jpmorgan.com
J.P. Morgan Securities LLC

Source: Bloomberg Finance

Perhaps more importantly, IPPs *relative* to BTM, a relationship that peaked in *August of 2025* (which in hindsight was the earliest sign of pain to come for power) looks like it bottomed in May. IPPs have outperformed BTM by 40% since the May low. I don't think it's any coincidence that this relationship bottomed before a handful of deals contracting on existing capacity (putting to bed the bear case of 1:1 additionality). The market sniffed out that the relationship between the two had swung too far in favor of BTM months before the news corroborated it. IPPs led the move down in power, I'm guessing they're going to lead the way up.

Listen to the tape, it's telling you that forward read for power is improving, not getting worse.

IPPs vs. BTM Has Turned...

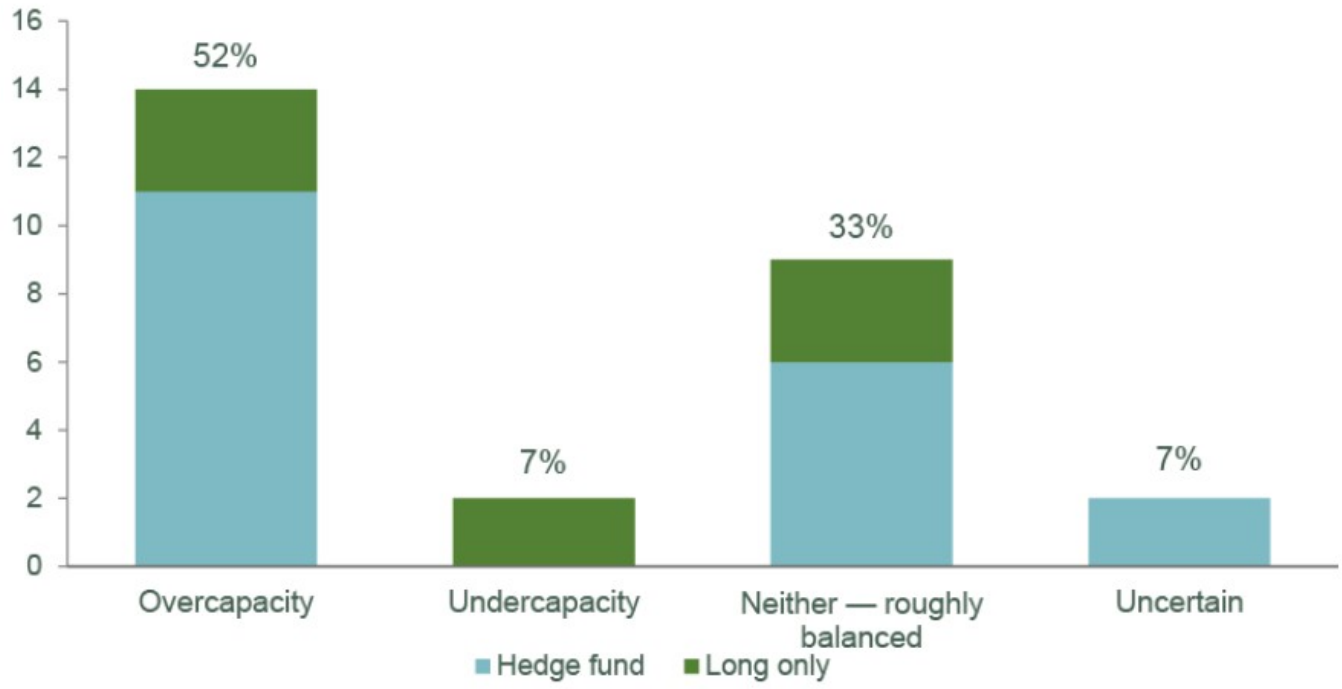

Source: Bloomberg Finance

So, yes, with data points like the majority (52%) of your peers thinking there will be BTM overcapacity by 2030 at a time where power positioning is net short across most sub-verticals, it's probably time to be contrarian. After all, when it comes to this negative narrative, *it's already priced in.* Not only is behind the-meter at the index level down more than 30% (32%, to be exact), under the surface it's far worse: **the average drawdown in the basket's constituents is a staggering 40%**. With some formerly-power-darlings now trading with little if any value ascribed to power (*hello KGS),* its fair to say that the onus is now firmly on the bears. Sounds like upside asymmetry to me….

Figure 22: BTM Capacity by FY30 Expectations

By FY30, do you believe there will be manufacturing overcapacity or undercapacity within behind the meter power?
Out of 27 responses

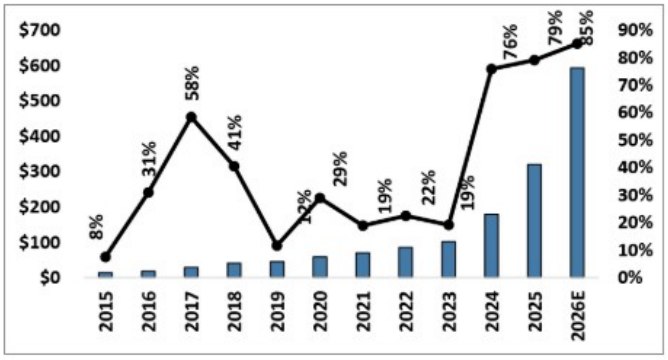

Source: J.P. Morgan

Oh, and in case you needed one more reason to be optimistic, try the data center capex outlook. Our Hardware & Networking team **just revised up their data center capex outlook from +80% to +85% growth in 2026** (here). On a dollar basis, this implies more than +$270 bn of additional data center capex in 2026, the largest annual step-up to date and above the record set in 2025. We are also raising our 2027 data center capex forecast to +70% growth, up from +50% prior, which while this implies some moderation in the growth rate, it translates into a new record increase of $400 bn+ in spending.

Source: Bloomberg Finance

Earnings for the Week Ahead (Spec Sales View):

- **10/19: CLF** - My sense is that CLF is now a crowded long for folks (has outperformed our steel index by 30% the trailing 3mo). As Bill & team flagged in their preview: "...with CAD HRC now tracking above $1,100/st and tight market conditions muting typical seasonality, we see upside to CLF's FY27 estimates (JPMe +24% vs. BBG) including from both STLC and non-auto fixed contract resets (est. 2Mtpa sheet)." By my sense, most folks are comfortably aligned with this view (upside to STe both for 4Q and FY27). Of course, there continues to be a decent amount of skepticism from folks on management's '27 EBITDA guide but now, given steel prices, even that has now abated some. (Research Preview)
- **10/20: HAL -** Even after last quarter's mishap, HAL is still a long for folks. With BKR (considered by most to be *the* consensus long in OFS) trading poorly amid the broader market degross, I wouldn't be surprised if HAL is back to being the most well-held OFS name into prints again. Investors see expectations as better calibrated after last quarter. Arun's preview frames the setup best in his preview: "*HAL setup is less about a heroic 3Q26 beat and more about whether the management team can convince investors that the 2027 margin bridge no longer requires a robust NAM environment.* " Probably even more importantly, Arun thinks HAL could speak to '27 margin expansion on the call. On 4Q, we see the downside risk, if there is any, as being in the Middle East given disruptions from the conflict. (Research Preview)
- **10/21: KMI -** Comfortably the best performing of gas names the past 3mo, folks are generally convinced that *others* are long KMI into the print. As to whether or not the *actual* positioning reflects that, I think that remains to be seen. The last two prints have been characterized by sizeable beats and disappointing price action. Folks are aware of that. For the quarter, the focus will be on project backlog, namely on Southeast Connector. From JT to consider, as well: "...we would not be surprised to see volatility into the 2027 guidance update, as 2026 optimization benefits rolling off and organic growth timing (Trident more 2028 weighted than 2027) could create a flatter YoY growth profile relative to peers."
- **10/21: LBRT -** Starting to become somewhat battleground-y positioning-wise, but I'd say it still falls on on the favored short list for folks in BTM land. Folks like SEI, KGS and perhaps even PUMP before LBRT. Folks also bear the scars of last quarters blowup (shares off 21% T0 post print). That anxiety and pecking order in BTM means the positioning setup should be supportive. While it doesn't seem like there is much buyside expectation for a contract update on the call, LBRT (as per company commentary) is still expected to sign ESAs for at least 500 MW of generation capacity with IG rated hyperscalers under attractive commercial terms prior to year-end. So there is always a small hope, I presume. On frac, from Arun " *While 2Q26 benefited from Private E&Ps accelerating DUC completions into a fleet that was already running well north of ~85% utilization, this setup appears difficult to replicate as the wider completions industry bumps up against a rig count that has added ~50 rigs and requires a 3-6 month lag to convert into completions work. We read this as a deferral of activity rather than an erosion of demand.*" (Research Preview)
- **10/22: PCG -** Still a long for folks after the wildfire drawdown. As for the quarter, we expect PCG to refrain from offering any material updates this quarter on the company's recently announced strategic review. On the regulatory front, we look for updates on PG&E's pending interim rate relief request, with a final vote expected as early as October 29. Finally, we expect PG&E to update its data center pipeline following 2Q's +7.6GW QoQ increase (Research Preview Here).
- **10/22: VLO -** Refiners positioning seems to change by the week. After being a HF short for most of the late summer/early fall, my sense is VLO is neutral to long into the print. While most don't seem to think 3Q estimates matter much (it's all about 4Q revisions & cracks), it seems as though the buyside is at ~$24 for 3Q (+13% vs. $21.33 STe). Some have suggested (in my surveying for such bogeys) that this appears optically low when considering VLO hasn't beaten by less than 15% since 2Q24. On 4Q (from our preview): "*Management is constructive on 4Q while cautioning it is only six days into the quarter and volatility could re-emerge, pointing to current inventory levels, continued strong demand, supportive DOE statistics, and resilient export demand.*" (Research Preview)
- **10/23: SLB -** Last quarter's squeeze (largest post-print advance since 2Q22) has done little to change pesimisstic SLB positioning. SLB is still the consensual short in large cap OFS land into the 3Q print as far as I can tell. Given the price action vs. revisions, this is, for many, for good reason. As several have flagged, SLB remains up ~30% despite the fact that '27 revisions are largely unchanged (and perhaps, given the ME unrest, may even have to go lower). The buyside expects the quarter to be uneventful and 4Q to be guided lower on Middle East issues. So, TLDR: negative positioning matches negative expectations.
    - From Arun for our research view on 4Q: "*...we do expect the lingering conflict to modestly impact 4Q26 Middle East*

revenue and EBITDA, particularly offshore. SLB's 4Q26 guidance commentary on the 2Q26 call outlined the potential to exceed $10bn of revenue (~5% YoY growth) at 24% EBITDA margins, which was in-line with 4Q25 levels. This embedded Middle East revenue reaching $2.1-2.2bn, or ~95% of ME revenue achieved in 4Q25, layered on top of deepwater momentum and typical year-end Digital/Production Systems sales. We now believe ~$250mm of 4Q26 Middle East revenue could be at risk, which would imply $125mm of 4Q26 EBITDA impact based on decrementals, assuming conservative assumptions."
